MACHEREY-NAGEL – About us

Quality since 1911

Since 1911 MACHEREY-NAGEL stands for high quality, innovation and reliability in chemical and biomolecular analysis. Friendly expert advice for our highly valued customers as well as outstanding product quality have been the cornerstones of our corporate success for more than 100 years. MACHEREY-NAGEL

is a family-owned company run by the fourth generation. As one of today's leading manufacturers of products for analytical chemistry and life science we offer a broad range of products for Filtration, Rapid Tests, Water Analysis, Chromatography and Bioanalysis.

MACHEREY-NAGEL – worldwide

Our customers can count on competent and reliable service all over the world.

- Headquarters and manufacturing site in Düren (Germany), further location in Oensingen (Switzerland)
- Globally operating network of qualified and specially trained distributors in more than 150 countries
- Branches in France, Switzerland and the United States with dedicated and expert staff

For a complete list of branches and authorized distributors see www.mn-net.com/distributor

1961

MACHEREY-NAGEL becomes one of the pioneers in TLC

1974

NUCLEOSIL® – one of the first spherical HPLC silicas leads to our core competence in silica technology

MACHEREY-NAGEL Chromatography – Complete solutions for your analysis

MACHEREY-NAGEL has grown from a pioneer in chromatography to a full-range supplier of laboratory consumables. We supply laboratories all over the world with HPLC, GC and SPE columns, TLC plates and sheets, syringe filters or suitable vials and closures. Our philosophy includes personal and competent

support as well as outstanding product quality. We have the demand to fulfill the customer's individual needs and offer optimal and reliable solutions for your lab work in method development and routine analysis.

How you can benefit from MACHEREY-NAGEL

- Competent and individual service
- More than 50 years of expertise in manufacturing of chromatographic adsorbents
- Comprehensive product portfolio covering all areas of chromatography consumables

MN on the internet

- Detailed product information and technical data can be found at www.mn-net.com
- Online application database with more than 3000 practical applications www.mn-net.com/apps
- Safety data sheet, certificates of analysis, instruction leaflets, flyers and catalogs can be downloaded online
- VialFinder: Your alternative! Easy selection by updated cross references
- FilterFinder: Always the suitable syringe filter - directly from the manufacturer
- HPLC and GC troubleshooting online
- You can find MACHEREY-NAGEL also on exhibitions www.mn-net.com/tradeshows

Solid phase extraction (SPE) is a powerful method for sample preparation and is used by most chromatographers today.

About 25 years ago MACHEREY-NAGEL designed and introduced CHROMABOND® SPE cartridges containing silica-based adsorbents. Since then we have developed the widest range of phases and products for SPE based on silica and polymeric materials.

SPE has capabilities in a broad range of applications

- Environmental analysis
- Pharmaceutical and biochemical analysis
- Organic chemistry
- Food analysis

SPE is a form of digital (step-wise) chromatography designed to extract, partition, and / or adsorb one or more components from a liquid phase (sample) onto a stationary phase (adsorbent or resin). An adsorbed substance can be removed from the adsorbent by stepwise increase of elution strength of the eluent (step gradient technique). SPE extends a chromatographic system's lifetime, improves qualitative and quantitative analysis, and the demand placed on an analytical instrument is considerably lessened.

In general, SPE is used for three important purposes in state-of-the-art analysis

- Concentration of the analyte – up to factor 10.000 - increase of chromatographic sensibility and improved limits of detection
- Removal of interfering compounds – protection of subsequent analysis like HPLC, GC, TLC, UV or IR spectroscopy, ...
- Changing an analyte's environment to a simpler matrix more suitable for subsequent analysis

Advantages of SPE compared to classical liquid-liquid extraction

- Lower consumption of solvents
- Faster – enormous time savings
- Lower costs per sample
- Potential for automation
- High consistency in individual sample handling
- More specific selectivity because of the broad range of adsorbents and different retention mechanisms
- Optimization of extraction by the variation or adjusting of the solid phase and chromatographic conditions

Separation of food additives

Since analytes can either be adsorbed on the SPE packing material or directly flown through while the interfering substances are retained, two general separation procedures are possible – both cases are shown in the figure above.

Main steps of the SPE procedure

① Conditioning of the adsorbent

Conditioning of the adsorbent is necessary in order to ensure reproducible interaction with the analyte. Conditioning, also called solvation, results in a wetting of the adsorbent and thus produces an environment, which is suitable for adsorption of the analyte. Nonpolar adsorbents are usually conditioned with 2–3 column volumes of a solvent, which is miscible with water (methanol, THF, 2-propanol etc.), followed by the solvent in which the analyte is dissolved (pure matrix, e.g., water, buffer). Polar adsorbents are conditioned with nonpolar solvents.

After the conditioning step the adsorbent bed must not run dry, because otherwise solvation is destroyed (deconditioning).

② Sample application (adsorption)

Sample application can be performed with positive or negative pressure with a flow rate of ~3 mL/min. Sample volumes vary from a few mL up to liters.

③ Washing of the adsorbent

Washing of the adsorbent is usually achieved with a special wash solution; however, in some cases it may not be necessary. If the polarity difference between wash solution and eluent is very large, or if both are not miscible, drying of the adsorbent bed after washing is recommended to improve elution and recovery.

④ Elution

Elution with a suitable eluent should not be too fast. The elution speed depends on the column or cartridge dimension and the quantity of adsorbent (about 1 mL/min).

Molecular interactions in SPE

SPE adsorbents are most commonly categorized by the nature of their primary interaction mechanism with the analyte of interest. The three most common extraction mechanisms used in SPE are reversed phase (RP), normal phase (NP) and ion exchange.

Typical extraction mechanisms

- Reversed phase extraction of hydrophobic or polar organic analytes from aqueous matrix
- Normal phase extraction of polar analytes from nonpolar organic solvents
- Ion exchange extraction of charged analytes from aqueous or nonpolar organic samples

Types of retention mechanisms

Nonpolar interactions

Silica-based: C₁₈ ec, C₁₈, C₁₈ Hydra, C₈
 Polymer-based: HR-X, HR-P, Easy, PS-RP
 Interactions: hydrophobic
 Sample: mostly aqueous
 Elution: solvents with lower polarity (compared to water)
 CH₃OH, CH₂Cl₂, CHCl₃, hexane

Polar interactions

Silica-based: SiOH, CN, NH₂, OH (diol), C₆H₅
 Other: Alox, Florisil®
 Interactions: hydrogen bonds, dipole-dipole and π-π interactions
 Sample: mostly organic
 Elution: polar solvents (compared to sample solvent), e.g., (nonprotic) ethers, ketones (MTBE, THF, acetone), CH₂Cl₂, CHCl₃

Cation exchangers

Silica-based: SA (SCX), PCA (WCX), PSA
 Polymer-based: HR-XC, HR-XCW, PS-H⁺
 Interaction: between charged analytes and functional group of cation exchanger
 Sample: aqueous (pH 3–5)
 Elution: acidic: pH 2 (e.g., HCl, or 20 % AcOH in CH₃OH – CH₃CN)
 basic: pH 8–9 (e.g., 5 % NH₃ in CH₃OH – CH₃CN) solvents or buffers with higher ionic strength and counter ions with high selectivity (e.g., Ca²⁺)

Anion exchangers

Silica-based: SB (SAX), NH₂
 Polymer-based: HR-XA, HR-XAW, PS-OH⁻
 Interaction: between charged analytes and functional group of anion exchanger
 Sample: aqueous (pH 8–9)
 Elution: basic: pH 10 (e.g., 20 % NH₃ in CH₃OH – CH₃CN)
 acidic: pH 4–5 (e.g., HCl, or 5 % AcOH in CH₃OH – CH₃CN) solvents or buffers with higher ionic strength and counter ions with high selectivity (e.g., citrate)

It should be noted, that in SPE the interactions described on page 12 are not found in pure form, but in combination. For example, modified silicas, unless they have been subjected to

endcapping (silanization of residual silanol groups with short-chain silanes), still possess free silanol groups, which can enter into secondary interactions.

Sample pretreatment

For direct extraction with adsorbents the sample matrix (sample environment) has to fulfill three conditions:

- The matrix has to be liquid, if possible with low viscosity
- Solids should be removed from the liquid matrix
- The matrix (sample environment) should be suitable for retention of the analyte

For solid samples there are different methods to convert the sample into a suitable matrix:

- Dissolution of the solid sample in a suitable solvent
- Lyophilization of the sample and dissolution in a suitable solvent
- Extraction of the solid sample with a suitable solvent
- Homogenization of the sample in a suitable solvent

In order to find the suitable solvent, one has to consider all desired sample components. Also, the suitable solvent should enhance retention of the analyte. For example, samples with large contents of solids are often homogenized in nonpolar solvents like hexane, while for samples with high water content dissolution in acids, bases, buffers or very polar solvents such as methanol is recommended.

Additionally, SPE allows to alter the properties of the sample matrix. If, for example, natural products are extracted with methanol or acetone, the polarity of the extracts can be increased by dilution with water, in order to enhance nonpolar solid phase extraction on the C₁₈ material.

Our CHROMABOND® QC policy

- Highest production standard – our facilities are EN ISO 9001:2008 certified
- All products are individually tested to meet our strict quality specifications, ensuring our outstanding product reproducibility, reliability and performance
- Perfect reproducibility from lot-to-lot and within every single batch:
 - Careful attention to particle size distribution and pore diameters assures consistent column flow
 - Chemical reproducibility is guaranteed by strict quality control throughout manufacturing
- Each product is supplied with a certificate of analysis stating the results of internal examinations and quality control

Design of columns, cartridges and 96-well plates

All CHROMABOND® columns, cartridges and 96-well plates are manufactured from polypropylene (PP) with lowest content of extractables (plasticizers, stabilizers, ...) offering blank value free results when using most common solvents.

The high quality CHROMABOND® adsorbents are kept in place by chemically very inert polyethylene filter elements (PE, standard pore size 20 µm).

CHROMABOND® polypropylene columns

- PP columns with PE filter elements
- Different sizes from 1, 3, 6 up to 150 mL
- Adsorbent weights from 20 mg to 50 g
- Male Luer tip as exit
- Compatible with most robots (e.g., Gilson® ASPEC™, Caliper AutoTrace®)

CHROMABOND® glass columns

- Glass columns with chemically very inert glass fiber filter elements (nominal pore size 1 µm)
- Two different sizes: 3 and 6 mL
- Available with all CHROMABOND® phases
- Excludes any influence from the column material (e.g., plasticizers)

CHROMAFIX® cartridges

- PP cartridges with PE filter elements
- Three different sizes with different adsorbent weights: Small (0.4 mL), Medium (0.8 mL), Large (1.8 mL)
- Female Luer fitting at the inlet, male Luer tip as exit
- Offers alternative way of handling using positive pressure by syringes or peristaltic pumps
- Especially suited for convenient solid phase extraction of small sample volumes

CHROMABOND® LV columns

- Large volume PP columns with PE filter elements
- Three different adsorbent weights (100, 200 and 500 mg)
- Funnel-shaped reservoir with 15 mL volume
- Especially for clinical samples - the whole sample (e.g., urine, serum, blood) can be applied to the column in one step
- Can be directly used in the Zymate® lab robots of Zymark

CHROMABOND® MULTI 96 · SPE in 96-well format

- 96-well PP plates with PE filter elements
- Cavity volume 1.5 mL
- Adsorbent weights 10, 25, 50 and 100 mg
- Supplied with any CHROMABOND® SPE adsorbents
- For the simultaneous preparation of 96 samples
- Easy method transfer from CHROMABOND® columns or CHROMAFIX® cartridges to CHROMABOND® MULTI 96
- Readily adaptable to all common automated / robotic handling systems (for details see page 69)

On-line SPE (see page 68)

- Online columns and cartridges
- SPE columns with caps and needles for the Gerstel MultiPurposeSampler (MPS)
- Columns for Gilson® ASPEC™ systems (ASP)

Method development kits

For the development kits as well as for all individual CHROMABOND®, CHROMABOND® LV and CHROMAFIX® types columns are sealed in units of five columns each to prevent adsorption of contaminants from the environment, e.g., laboratory air.

Designation	Contents of the kit	REF
Investigating the best separation mechanism for a clean-up procedure		
CHROMABOND® HR- <i>Xpert</i> development kit I	columns with 3 mL, 60 mg (particle size 45 µm): 10 columns with HR-X; 5 columns each with HR-XC, HR-XA, HR-XCW, HR-XAW	730723
CHROMABOND® HR- <i>Xpert</i> development kit II	columns with 3 mL, 200 mg (particle size 85 µm): 10 columns with HR-X; 5 columns each with HR-XC, HR-XA, HR-XCW, HR-XAW	730726
CHROMABOND® polymer development kit	5 columns each with 3 mL, 200 mg: HR-X, HR-XC (MCX), HR-XA (MAX), HR-P, Easy, PS-H ⁺ , PS-OH-	730288
CHROMABOND® standard development kit	5 columns each with 3 mL, 500 mg: C ₁₈ , C ₁₈ ec, C ₈ , C ₆ H ₅ , NH ₂ , DMA, OH (Diol), CN, SiOH, SA (SCX), SB (SAX)	730496
Selecting the optimum RP phase for a clean-up procedure		
CHROMABOND® RP development kit I	10 columns each with 3 mL, 500 mg: C ₁₈ , C ₁₈ ec, C ₈ , C ₄ and 10 columns each with 3 mL, 200 mg HR-P, HR-X	730197
CHROMABOND® RP development kit II	10 columns each with 1 mL, 100 mg: C ₁₈ , C ₁₈ ec, C ₈ , C ₄ , HR-P, HR-X	730207
CHROMAFIX® RP development kit I	10 cartridges each CHROMAFIX® S: C ₁₈ , C ₁₈ ec, C ₈ , C ₄ , HR-P, HR-X	731883
CHROMABOND® RP development kit III	10 columns each with 3 mL, 500 mg: C ₁₈ , C ₁₈ ec, C ₁₈ Hydra, C ₈ and 10 columns each with 3 mL, 200 mg HR-P, HR-X	730490
CHROMABOND® RP development kit IV	10 columns each with 1 mL, 100 mg: C ₁₈ , C ₁₈ ec, C ₁₈ Hydra, C ₈ , HR-P, HR-X	730491
CHROMAFIX® RP development kit II	10 cartridges each CHROMAFIX® S: C ₁₈ , C ₁₈ ec, C ₁₈ Hydra, C ₈ , HR-P, HR-X	731886
Selecting the optimum polar phase for a clean-up procedure		
CHROMABOND® polar development kit I	10 columns each with 3 mL, 500 mg: SiOH, Florisil®, NH ₂ , CN, OH (Diol)	730199
CHROMABOND® polar development kit II	10 columns each with 1 mL, 100 mg: SiOH, Florisil®, NH ₂ , CN, OH (Diol)	730208
CHROMAFIX® polar development kit	10 cartridges each CHROMAFIX® S: SiOH, Florisil®, NH ₂ , CN, OH (Diol)	731884
Selecting the optimum ion exchanger for a clean-up procedure		
CHROMABOND® ion exchange development kit I	10 columns each with 3 mL, 500 mg: SA (SCX), SB (SAX), HR-XC (MCX), HR-XA (MAX), PS-OH ⁺ , PS-H ⁺ , DMA	730206
CHROMABOND® ion exchange development kit II	10 columns each with 1 mL, 100 mg: SA (SCX), SB (SAX), HR-XC (MCX), HR-XA (MAX), PS-OH ⁺ , PS-H ⁺ , DMA	730209
CHROMAFIX® ion exchange development kit I	10 cartridges each CHROMAFIX® S: SA (SCX), SB (SAX), HR-XC (MCX), HR-XA (MAX), PS-OH ⁺ , PS-H ⁺ , DMA	731885
CHROMABOND® cation exchange development kit I	10 columns each with 3 mL, 500 mg: SA (SCX), PSA, PCA, HR-XC (MCX), HR-XCW (WCX), PS-H ⁺	730494
CHROMAFIX® cation exchange development kit	10 cartridges each CHROMAFIX® S: SA (SCX), PSA, PCA, HR-XC (MCX), HR-XCW (WCX), PS-H ⁺	731888
Phase selection for clean-up procedures for environmental samples		
CHROMABOND® kit I environmental sample preparation	10 columns each with 3 mL, 200 mg HR-P; 6 mL, 1000 mg C ₁₈ ec; 6 mL, 2000 mg C ₁₈ PAH; 6 mL, 500/1000 mg CN/SiOH; 3 mL, 500/500 mg SA/SiOH	730205
CHROMABOND® kit II environmental sample preparation	5 columns each with 3 mL, 500/500 mg SiOH-H ₂ SO ₄ /SA; 3 mL, 500 mg SiOH; 6 mL, 1000 mg Florisil®; 3 mL, 500/500 mg SA/SiOH; 6 mL, 700/2000/700 mg NAN	730349

The professional concept of innovative SPE phases

The CHROMABOND® HR-Xpert family comprises 5 polymer-based RP and mixed-mode ion exchange phases:

- CHROMABOND® HR-X hydrophobic PS/DVB copolymer
- CHROMABOND® HR-XC strong mixed-mode cation exchanger
- CHROMABOND® HR-XA strong mixed-mode anion exchanger
- CHROMABOND® HR-XCW weak mixed-mode cation exchanger
- CHROMABOND® HR-XAW weak mixed-mode anion exchanger

State-of-the-art spherical polymer

- Two particle sizes (45 µm and 85 µm) adequate for different sample volumes and matrices
- Broad spectrum of application with special suitability for the enrichment of pharmaceuticals from biological matrices
- Ideal flow properties due to low content of particulate matter

Optimized pore structure and high specific surface

- High loadability and outstanding elution properties
- Low solvent consumption
- Rapid, economical analysis

High-purity adsorber material

- Allows highest reproducibility with extremely low blind values
- Reliable analysis at ultra trace level
- No method adaptation for new batches necessary

Adsorbent blind values:

The HR-Xpert concept guarantees

- RP and mixed-mode SPE phases with distinct ion exchange and reversed phase properties: excellent enrichment of neutral, acidic and basic compounds
- Modern, spherical support polymer with optimized pore structure and high surface: good reproducibility, reliable and cost-efficient analysis
- Possibility for more aggressive washing procedures for matrix removal: cleaner samples and protection of your HPLC and GC instruments
- Quantification of analytes also from heavily contaminated samples: lower limits of detection also for critical matrices

CHROMABOND® HR-Xpert is the perfect combination for all tasks in sample preparation.

Chemical structures of the phases

CHROMABOND® HR-X

hydrophobic polystyrene-divinylbenzene copolymer
spherical base material for efficient enrichment
and ideal flow behavior

CHROMABOND® HR-XCW

weak acidic
cation exchanger

CHROMABOND® HR-XA

strong basic
anion exchanger

CHROMABOND® HR-XAW

weak basic
anion exchanger

CHROMABOND® HR-XC

strong acidic
cation exchanger

Similar phases

CHROMABOND® HR-X:	Oasis® HLB, Strata™-X, Nexus, ENVI-Chrom P
CHROMABOND® HR-XC:	Oasis® MCX, Strata™-X-C, HyperSep™ Retain™-CX, StyreScreen® DBX
CHROMABOND® HR-XA:	Oasis® MAX, Strata™-X-A, HyperSep™ Retain™-AX, StyreScreen® QAX
CHROMABOND® HR-XCW:	Oasis® WCX, Strata™-X-CW
CHROMABOND® HR-XAW:	Oasis® WAX, Strata™-X-AW

2 particle sizes - 1 goal: HR-Xpert for optimized sample preparation

For different application requirements the particle sizes complement each other perfectly.

Ideal for:

- Smaller sample volumes
- Smaller adsorbent weights
- Lower elution volumes

Recommended for:

- Large volume or viscous samples, heavy matrix load
- Operation without vacuum possible (e.g., for volatile analytes)
- Higher adsorbent weight without increase in back pressure

Features of 45 µm particles

- About half the radius results in 8-fold particle number per volume for approx. equal adsorbent weight
- Same specific surface for both particle sizes: considerably larger freely accessible external surface for 45 µm particles
- Denser adsorbent packing: enhanced interaction of the analyte with the adsorbent, better extraction results

Ideal elution characteristics

Method: 1 mL column with 30 mg CHROMABOND® HR-X, 1 mL standard solution (1 mg/mL hexobarbital), drying, elution in portions of 100 µL with methanol (see application 305490 at www.mn-net.com/apps)

Recovery rates 45 µm

Advantages of 45 µm particles:

- Faster elution
- Lower elution volumes required

Recovery rates 85 µm

Breakthrough behavior in enrichment

Method: 1 mL column with 15 mg CHROMABOND® HR-X, apply portions of 1 mL standard solution (250 µg/mL hexobarbital in water), collect eluates (see application 305480 at www.mn-net.com)

45 µm (red) The analyte is completely retained up to fraction 10.

85 µm (blue) Small amounts even break through with fraction 4.

45 µm particles provide better enrichment and breakthrough behavior for small adsorbent weights. When using larger adsorbent weights this effect is less pronounced, since then analytes have sufficient contact with the 85 µm adsorbent particles as well.

45 µm particles are ideal for small sample and elution volumes, while for large amounts of sample and adsorbent 85 µm particles show advantages due to better flow properties.

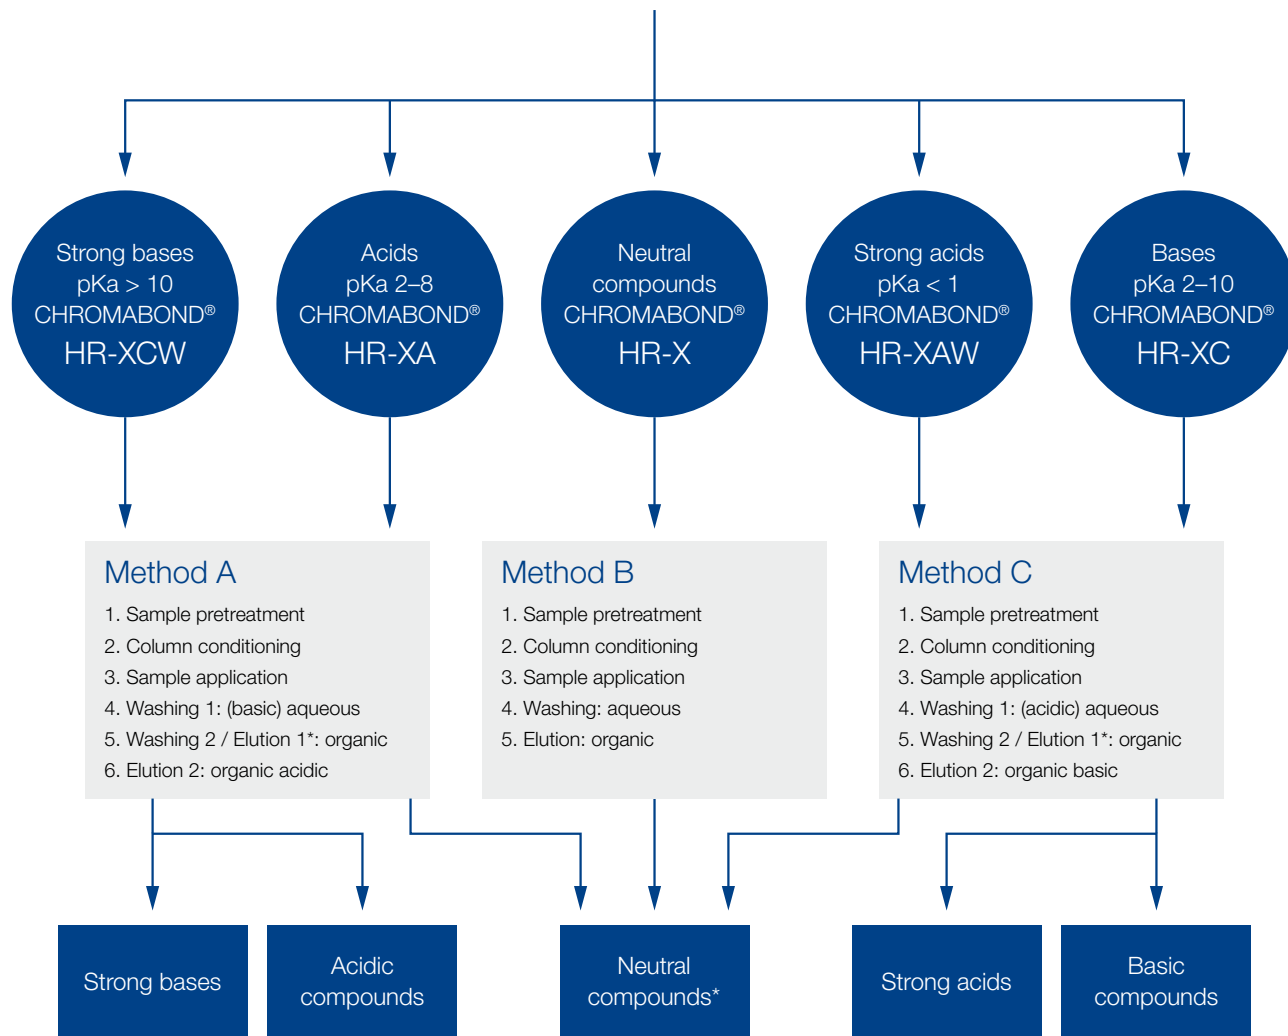

The CHROMABOND® HR-*Xpert* concept for neutral, acidic and basic analytes

3 paths - 1 goal: cleaner samples

Depending on the character of the analytes HR-*Xpert* offers suitable adsorbents and optimal methods for sample preparation, cleaning and concentration.

* Under organic washing and elution conditions the following compounds will be also eluted

HR-X: polar compounds such as organic acids and bases
HR-XC, HR-XCW: acidic components and impurities
HR-XA, HR-XAW: basic components and impurities

CHROMABOND® HR-X HR-X spherical, hydrophobic polystyrene-divinylbenzene adsorbent resin

★ Key features

- High-purity material with highest reproducibility and lowest blank values due to an optimized manufacturing process
- Excellent recovery rates especially for the enrichment of pharmaceuticals and active ingredients due to the spherical structure of the particles, very homogeneous surface and optimized pore structure

🔧 Technical characteristics

- Hydrophobic polystyrene-divinylbenzene copolymer, pH stability 1–14
- Spherical particles, size 45 µm and 85 µm (standard), pore size 55–60 Å, very high surface 1000 m²/g, capacity 390 mg/g (caffeine in water)

✓ Recommended application

- Pharmaceuticals / active ingredients from tablets, creams and water / waste water
- Drugs and pharmaceuticals from urine, blood, serum and plasma
- Trace analysis of pesticides, herbicides, phenols, PAHs and PCBs from water

Drugs from water

MN Appl. No. 304240

Column type:
CHROMABOND® HR-X, 3 mL, 200 mg
REF 730931

Sample: 1 µg/mL each in water

Column conditioning: 5 mL methanol, 5 mL dist. water

Sample application:

slowly aspirate 500 mL water (pH 3) through the column

Column washing: 5 mL water

Elution: after drying 3 x 2 mL acetonitrile

Further analysis: HPLC on NUCLEODUR® C₁₈ Gravity, 5 µm; see MN Appl. No. 121690

Recovery rates [%]

Compound	HR-X	Strata™ X

Pesticides from water

MN Appl. No. 304250 / 304260

Column type:
CHROMABOND® HR-X, 3 mL, 200 mg
REF 730931

Sample pretreatment: samples are spiked with 500 ng of each pesticide in 1000 mL water, adjusted to pH 2 with HCl or pH 7

Column conditioning:

10 mL methanol, 10 mL dist. water

Sample application:

slowly pass 1000 mL spiked water sample through the column with the aid of a tubing adapter (REF 730243)

Elution: after drying 5 mL methanol – THF (1:1, v/v)

Further analysis: HPLC

Standard protocol for CHROMABOND® HR-X

MN Appl. No. 304310

Column type:
CHROMABOND® HR-X, 3 mL, 200 mg
REF 730931

Sample pretreatment: if necessary, adjust pH value

Column conditioning: 5 mL methanol

Equilibration: 5 mL water

Sample application: slowly aspirate the sample through the column

Column washing: 5 mL water – methanol (95:5, v/v)

Elution: after drying 3 x 2 mL methanol

Further analysis: if necessary, evaporate and redissolve in a suitable solvent; HPLC or GC

Highest reproducibility Barbiturates from serum

MN Appl. No. 304290

Column type:
CHROMABOND® HR-X, 3 mL, 200 mg
REF 730931

Sample: 100 ng/mL each in serum

Column conditioning: 5 mL methanol, 5 mL dist. water

Sample application: 1 mL spiked serum

Column washing: 5 mL water

Elution: after drying 3 x 2 mL methanol

Further analysis: HPLC on NUCLEODUR® 100-5 C₁₈ ec, see MN Appl. No. 117820

CHROMABOND® HR-XC strong cation exchanger

★ Key features

- High purity material, highest reproducibility and lowest blank values due to an optimized production process
- Outstanding recovery rates especially for the enrichment of basic analytes

🔧 Technical characteristics

- Strong acidic benzenesulfonic acid cation exchanger, exchange capacity 1.0 meq/g, base material polystyrene-divinylbenzene copolymer, pH stability 1–14
- Spherical particles, size 45 µm and 85 µm (standard), pore size 65–75 Å, very large specific surface 800 m²/g, pore volume 1.4 cm³/g, RP capacity 300 mg/g (caffeine in water)

✓ Recommended application

- Basic active ingredients from heavily matrix-contaminated samples like, e.g., urine, plasma, serum
- Fungicides from food
- Basic analytes like, e.g., amines
- Bases with pKa 2–10

Standard protocol for CHROMABOND® HR-XC

MN Appl. No. 304790

 **Column type:**
CHROMABOND® HR-XC, 3 mL, 200 mg
REF 730952

Sample pretreatment: adjust pH value if necessary

Column conditioning: 5 mL methanol

Equilibration: 5 mL water

Sample application: slowly aspirate sample through the column

Column washing 1: 2 mL 0.1 mol/L HCl in Wasser

Column washing 2 / Elution 1: 2 mL methanol (neutral and acidic compounds); if necessary, further washing steps

Elution 2: after drying 5 mL methanol – 5 % NH₃ (basic compounds)

Further analysis: if necessary, evaporate and redissolve in a suitable solvent; HPLC or GC

Fractionation of acidic, neutral and basic analytes from serum

MN Appl. No. 304780

 **Column type:**
CHROMABOND® HR-XC, 3 mL, 200 mg
REF 730952

Sample: 1 mL spiked matrix, acidified with 200 µL 2 % H₃PO₄

Column conditioning: 5 mL methanol, then 5 mL water

Sample application: slowly aspirate sample through the column

Column washing: 2 mL 0.1 mol/L HCl

Elution: 2.5 mL methanol (fraction A: neutral and acidic analytes); then 5 mL methanol – NH₃ 90:10, v/v (fraction B: basic analytes)

Further analysis:

for fraction A:

HPLC, e.g., on NUCLEODUR® C₁₈ Gravity, see MN Appl. No. 122230;

for fraction B:

HPLC on NUCLEODUR® C₈ Gravity, see MN Appl. No. 118520

CHROMABOND® HR-XA strong anion exchanger

★ Key features

- High purity material with highest reproducibility and lowest blank values due to an optimized production process
- Outstanding recovery rates especially for the enrichment of acidic analytes

🔧 Technical characteristics

- Strong basic quaternary ammonium anion exchanger, exchange capacity 0.25 meq/g, pKa ~ 18, base material polystyrene-divinylbenzene copolymer, pH stability 1–14
- Spherical particles, size 45 µm and 85 µm (standard), pore size 55–65 Å, very large specific surface 850 m²/g, pore volume 1.4 cm³/g, RP capacity 350 mg/g (caffeine in water)

✓ Recommended application

- Acidic active ingredients from heavily matrix-contaminated samples like, e.g., urine, plasma, serum
- Phenolic acids
- Acidic herbicides
- Weak / medium-strength acids with pKa 2–8

Standard protocol for CHROMABOND® HR-XA

MN Appl. No. 304970

Column type:

CHROMABOND® HR-XA, 3 mL, 200 mg

REF 730951

Sample pretreatment:

individual sample preparation with reference to analytes and matrix

Column conditioning: 5 mL methanol

Equilibration: 5 mL water

Sample application: slowly aspirate sample through the column

Column washing 1: 2 mL 0.1 mol/L NaOH in water

Column washing 2 / Elution 1: 2 mL methanol (neutral and basic compounds), if necessary, further washing steps

Elution 2: after drying 5 mL methanol – 1 to 10 % formic acid (acidic compounds)

Further analysis: if necessary, evaporate and redissolve in a suitable solvent; HPLC or GC MN Appl. No. 304970

CHROMABOND® HR-XCW weak cation exchanger

★ Key features

- High purity material, highest reproducibility and lowest blank values due to an optimized production process
- Outstanding recovery rates especially for enrichment of strongly basic analytes

🔧 Technical characteristics

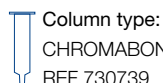

- Weak acidic carboxylic acid cation exchanger, exchange capacity >0.7 meq/g, pKa ~ 5, base material spherical PS/DVB copolymer, pH stability 1–14
- Spherical particles, size 45 µm and 85 µm (standard), pore size 50–60 Å very large specific surface 850 m²/g, pore volume 1.2–1.4 cm³/g, RP capacity 350 mg/g (caffeine in water)

✓ Recommended application

- Basic compounds like quaternary amines
- Active ingredients from heavily matrix-contaminated samples like, e.g., urine, plasma, serum
- Strong bases with pKa > 10

Standard protocol for CHROMABOND® HR-XCW

MN Appl. No. 305300

Column type:

CHROMABOND® HR-XCW, 3 mL, 200 mg

REF 730739

Sample pretreatment:

individual sample preparation with reference to analytes and matrix

Column conditioning: 5 mL methanol, 5 mL water

Sample application:

slowly aspirate sample through the column

Column washing 1: 2 mL acidified water

Column washing 2 / Elution 1: 2 mL methanol (neutral and acidic compounds), further washing steps if necessary

Elution 2: after drying 2 x 2 mL methanol – 1 to 5 % formic acid (strongly basic compounds)

Further analysis: if necessary, evaporate and redissolve in a suitable solvent; HPLC or GC

CHROMABOND® HR-XAW weak anion exchanger

★ Key features

- High purity material with highest reproducibility and lowest blank values due to an optimized production process
- Outstanding recovery rates especially for enrichment of acidic analytes

🔧 Technical characteristics

- Weak basic secondary and tertiary ammonium anion exchanger, exchange capacity >0.5 meq/g, pKa ~ 6, base material spherical PS/DVB copolymer, pH stability 1–14
- Spherical particles, size 45 µm and 85 µm (standard), pore size 55–65 Å very large specific surface 850 m²/g, pore volume 1.2–1.4 cm³/g, RP capacity 350 mg/g (caffeine in water)

✓ Recommended application

- Perfluorinated surfactants
- Acidic compounds like sulfonates
- Active ingredients from heavily matrix-contaminated samples like, e.g., urine, plasma, serum
- Strong acids with pKa < 1

Standard protocol for CHROMABOND® HR-XAW

MN Appl. No. 305200

 **Column type:**
CHROMABOND® HR-XAW, 3 mL, 200 mg
REF 730748

Sample pretreatment:

individual sample preparation with reference to analytes and matrix

Column conditioning: 5 mL methanol

Equilibration: 5 mL water

Sample application:

slowly aspirate sample through the column

Column washing 1: 25 mmol/L ammonium acetate

Column washing 2 / Elution 1: 2 mL methanol (neutral and basic compounds), if necessary, further washing steps

Elution 2: after drying 2 x 2 mL methanol – 1 to 5 % ammonia (strongly acidic compounds)

Further analysis: if necessary, evaporate and redissolve in a suitable solvent; HPLC or GC

Analysis of perfluorinated surfactants from water

MN Appl. No. 305140

Application in accordance with DIN 38407-42

 **Column type:**
CHROMABOND® HR-XAW, 3 mL, 60 mg
REF 730747

Sample: 500 mL water, spiked with 1 mL standard solution (20 µg/L of each compound)

Column conditioning:

2 mL methanol + 5 % ammonia, then 2 mL methanol, finally 2 mL water

Sample application:

slowly aspirate sample through the column

Column washing: 2 mL water, then 2 mL acetone – acetonitrile – formic acid (50:50:1, v/v/v), finally 2 mL methanol

Elution: 2 mL methanol with 5 % ammonia

Further analysis: evaporate to dryness in a stream of nitrogen under slight heating, and redissolve in a suitable solvent for HPLC

CHROMABOND® Easy polar, bifunctionally modified polystyrene-divinylbenzene copolymer

★ Key features

The Easy effect:

- Without preconditioning
- Due to bifunctional modification much more hydrophilic than conventional polystyrene-divinylbenzene polymers
- Easily wettable with water

🔧 Technical characteristics

- Polar modified polystyrene-divinylbenzene copolymer with a weak anion exchanger, specific surface 650–700 m²/g, particle size 80 μm, pore size 50 Å, pH stability 1–14

✓ Recommended application

- Polar herbicides and pesticides from water (acidic, neutral, basic), polar phenols from water, polyaromatic compounds, polychlorinated biphenyls
- Drug analysis from urine, blood, serum, plasma
- Pharmaceuticals and active ingredients from tablets, creams

Recovery of pesticides

MN Appl. No. 303220

Private communication Mr. Kühn, GUB, Waldshut Tiengen, Germany

Column type:
CHROMABOND® Easy, 3 mL, 200 mg
REF 730754

Column conditioning:
1 mL water, 3 mL methanol, 1 mL water

Sample application:
aspirate the sample through the column

Elution:
3 x 1 mL acetone

Further analysis: HPLC with NUCLEOSIL® 120-5 C₁₈

CHROMABOND® HR-P polystyrene-divinylbenzene adsorbent resin

★ Key features

- Very high binding capacity, up to 30 % of adsorbent weight (for comparison: silica adsorbents about 3 %)

🔧 Technical characteristics

- Highly porous polystyrene-divinylbenzene copolymer, specific surface 1200 m²/g, particle size 50–100 µm

✓ Recommended application

- Aromatic compounds, phenols from water, nitroaromatics from water, pesticides from water, PAHs from oil

Aromatic amines from water samples

MN Appl. No. 301810

Private communication M. Leß, T.C. Schmidt, Department of Chemistry, University Marburg, 1997

Compounds investigated: aromatic amines

Column type:

CHROMABOND® HR-P, 3 mL, 200 mg
REF 730108

Sample pretreatment: adjust to pH 9 using 10 mol/L NaOH

Column conditioning: 2 mL each of methanol, acetonitrile and 10⁻⁵ mol/L aqueous sodium hydroxide solution

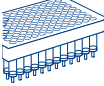

Sample application: aspirate sample through the column with about 10 mL/min

Column washing: wash with 2 mL dist. water, dry 5 min under vacuum

Elution: 3 x 1 mL methanol – acetonitrile (1:1, v/v)

For recovery rates of numerous aromatic amines please see application 301810 at www.mn-net.com/apps

CHROMABOND® PS-RP / PS-OH⁻ / PS-H⁺ / PS-Mix / PS-Ag⁺ / PS-Ba²⁺ phases for RP and ion chromatography

★ Key features

- Very low degree of swelling, thus very well suited for chromatography, reliable function over the whole pH range from 0–14

🔧 Technical characteristics

- Base material high purity polystyrene-divinylbenzene copolymers (PS/DVB), pore size 100 Å, particle size 100 µm
- Different modifications for different applications from the elimination of nonpolar compounds up to the removal of specific polar components

✓ Recommended application

- Removal of interfering compounds
- Improves chromatographic separation, if the interfering components overlap with the analyte in the chromatogram
- Improves lifetime of the chromatographic column, since interfering components can irreversibly block the column packing
- Enrichment of the analytes

Properties of the individual modifications

PS-RP	hydrophobic PS/DVB copolymer	removal of organic interfering components from water
PS-OH ⁻	strong PS/DVB anion exchanger, OH ⁻ form capacity 0.6 meq/g	removal or concentration of anions from water increasing the pH value in acidic samples
PS-H ⁺	strong PS/DVB cation exchanger, H ⁺ form capacity 2.9 meq/g	removal or concentration of cations from water decreasing the pH value of basic samples
PS-Mix	mixture of PS-OH ⁻ and PS-H ⁺	desalting of water
PS-Ag ⁺	strong PS/DVB cation exchanger, Ag ⁺ form	removal of halide ions from water
PS-Ba ²⁺	strong PS/DVB cation exchanger, Ba ²⁺ form	removal of sulfate ions from water

Removal of halides from aqueous samples shown for the trace analysis of nitrate besides an excess of chloride or bromide

MN Appl. No. 301930 / 302750

Compounds investigated:

20 ppm nitrate besides 2500 ppm chloride or 500 ppm bromide

Column type:

CHROMAFIX® PS-Ag⁺ (M) 0.8 mL, Ø 480 mg
REF 731865

Column conditioning: 1 mL dist. water

Sample application and Elution:

apply 4 x 1 mL sample fractions to the cartridge, discard 1st mL, collect 2nd, 3rd and 4th mL separately

Further analysis: HPLC with column 250 x 4 mm NUCLEOSIL® Anion II; eluent 2 mmol/L potassium hydrogen phthalate pH 6, 2 mL/min; detection: indirect UV, 280 nm (see applications 110440 and 110450 at www.mn-net.com/apps)

CHROMABOND® reversed phases

CHROMABOND® C₁₈ ec / C₁₈ ec f (f = fast flow) octadecyl silica, endcapped

★ Key features

- Very nonpolar, hydrophobic interactions with a wide variety of organic compounds
- Advantageous for the clean-up of samples with large structural variations (polarity differences)

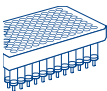

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm for C₁₈ ec, 100 µm for C₁₈ ec f (for fast flow), specific surface 500 m²/g, pH stability 2–8
- Octadecyl phases, endcapped, carbon content 14 %

✓ Recommended application

- Nonpolar compounds
afatoxins, amphetamines, antibiotics, antiepileptics, barbiturates, caffeine, drugs, preservatives, fatty acids, nicotine, PAHs, pesticides, PCBs, heavy metals, vitamins
- Very well suited for desalting of samples
- C₁₈ ec f for viscous samples

CHROMABOND® C₁₈/C₁₈ f (f = fast flow) octadecyl silica

★ Key features

- Similar to C₁₈ ec, however possesses more free silanols (SiOH), which allow secondary interactions with polar groups of the analytes

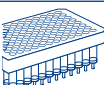

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm for C₁₈, 100 µm for C₁₈ f (for fast flow), specific surface 500 m²/g, pH stability 2–8
- Octadecyl phases, not endcapped, carbon content 14 %

CHROMABOND® C₁₈ Hydra octadecyl silica for polar analytes

★ Key features

- Special octadecyl phase for polar analytes, not endcapped, carbon content 15 %

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8

✓ Recommended application

- Polar compounds like pesticides and their polar degradation products, phenols, phenoxy-carboxylic acids

Pesticides from water

MN Appl. No. 302060

Compounds investigated: triazines and carboxylic amides

📏 Column type:

CHROMABOND® C₁₈ Hydra, 6 mL, 2 g
REF 730301

Sample pretreatment: adjust 1000 mL water to pH 7–8 with diluted NH₃ and add 100 µL of the internal standards (1 µg/L).

Column conditioning: 2 x 5 mL methanol, then 2 x 5 mL dist. water

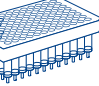

Sample application: force or aspirate the sample through the column. Then dry for 2 h with 2 bar N₂.

Elution: slowly aspirate 10 mL methanol through the column. Evaporate the eluate to dryness in a tapered flask with a rotation evaporator at 30 °C and store in a refrigerator for ~15 min. Redissolve the residue in 200 µL cold, fresh *n*-hexane and transfer the solution to a conic HPLC vial (e.g., REF 702891). Store the solution in a refrigerator until chromatography.

Recovery rates: between 95 and 100 %

Further analysis: GC with OPTIMA® δ-3 or OPTIMA® δ-6 (e.g., application 250420) or HPLC in accordance with EN ISO 11369: 1997 on NUCLEOSIL® 120-3 C₁₈ (application 110880)

CHROMABOND® C₈ octyl silica

★ Key features

- Similar to C₁₈, however slightly more polar
- Secondary interactions with polar compounds are more pronounced due to shorter alkyl chains

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8
- Octyl phase, not endcapped, carbon content 8 %

✓ Recommended application

- Pesticides, PCBs

CHROMABOND® C₄ butyl silica

★ Key features

- Slightly more polar than C₁₈ or C₈, due to shorter alkyl chains the silica surface is not completely shielded

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8
- Butyl phase, not endcapped, carbon content 7 %

✓ Recommended application

- Compounds, which are too strongly retained on C₁₈ or C₈ e.g., analgetics from blood

CHROMABOND® C₆H₁₁ ec cyclohexyl silica, endcapped

★ Key features

- Alternative phase for the midpolar range

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8
- Cyclohexyl phase, endcapped, carbon content 9 %

✓ Recommended application

- Phenols from water
- Chloroanilines from waste water
- Anthelmintics from tissue

Comparison of different phases for phenol analysis

MN Appl. No. 302150

Compounds investigated: phenol, 2,4-dinitrophenol, pentachlorophenol

Column types:

CHROMABOND® C₁₈, 6 mL, 2000 mg

REF 730130

CHROMABOND® C₆H₁₁ ec, 6 mL, 2000 mg

REF 730469

Column conditioning: 10 mL acetone, 10 mL methanol, and 10 mL dist. water (pH 2)

Sample application: aspirate the sample through the column.

Elution: 10 mL methanol

Ordering information

CHROMABOND[®] C₆H₅ phenyl silica

★ Key features

- Polarity similar to C₈
- In addition to hydrophobic interactions more selective adsorption is possible by π-π interactions due to the electron density of the phenyl ring.

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 μm, specific surface 500 m²/g, pH stability 2–8
- Phenyl phase, carbon content 8 %

✓ Recommended application

- Aflatoxins, caffeine, phenols

Flavor compounds from brandy

MN Appl. No. 300170

Compounds investigated: asarone, quinine, coumarin, quassin

Column type:

CHROMABOND[®] C₆H₅, 6 mL, 1000 mg

REF 730412

Sample pretreatment: mix 10 mL sample with 90 mL water and 10 g sodium chloride and adjust to pH 7 with 0.1 mol/L sodium hydroxide solution

Column conditioning: 10 mL methanol, then 10 mL dist. water

Sample application: slowly force or aspirate the sample through the column

Column washing: 2.5 mL water, then 2.5 mL pentane

- Elution:**
- 1) 2 x 2.5 mL pentane – diethyl ether (7:3, v/v): asarone, coumarin
 - 2) 10 mL 1 mol/L basic methanol – diethyl ether (9:1, v/v): quinine
 - 3) 5 mL chloroform: quassin

CHROMABOND® SiOH unmodified silica

★ Key features

- Very polar
- Adsorbs humidity from air, for this reason it should be kept well closed and if necessary dried before use
- Due to its high affinity for polar compounds it should not be conditioned with polar (e.g., methanol) or water-containing solvents.

🔧 Technical characteristics

- Unmodified, weakly acidic silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8

✓ Recommended application

- Aflatoxins, chloramphenicol, pesticides, steroids, vitamins

CHROMABOND® NH₂ aminopropyl silica

★ Key features

- Polar, weak anion exchanger

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8
- Aminopropyl phase, carbon content 3.5 %

✓ Recommended application

- Trace elements, lipids

Metals: trace elements from water

MN Appl. No. 301910

Compounds investigated: Al, Be, Cu, Cr(VI), Mo(VI), V(V)

Column type:

CHROMABOND® NH₂, 3 mL, 500 mg

REF 730033

Sample pretreatment:

mix 100 mL water sample with 5 mL 0.001 % alizarinsulfonic acid solution and adjust to pH 5.5 with acetic acid or sodium acetate

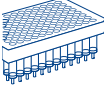

Column conditioning: 2 column volumes 1 mol/L nitric acid, then 2 column volumes dist. water

Sample application: force or aspirate sample through the column with 3–4 mL/min

Column washing: 2 mL dist. water; dry column under vacuum for 4 min

Elution: 2 column volumes 2 mol/L nitric acid

CHROMABOND® HILIC zwitterionic polar phase with ammonium sulfonic acid modification

Technical characteristics

- Basic material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8

Recommended application

- Polar organic acids and bases, polar natural compounds, nucleosides, oligonucleotides, amino acids, peptides, water-soluble vitamins

Hydrophilic interaction liquid chromatography

A water-rich layer is formed on the surface of the adsorbent, which enables stronger interactions for polar than for nonpolar analytes. Thus polar analytes are more strongly retained than nonpolar compounds. This behavior is inverse (orthogonal) to RP materials like, e.g., CHROMABOND® C₁₈ ec.

In HILIC-HPLC (e.g., NUCLEODUR® HILIC) increase of the portion of water in the eluent results in reduction of the retention times – consequently enrichment in SPE is the more difficult, the higher the portion of water in the sample matrix. Elution of the analytes is achieved with water.

Standard protocol MN Appl. No. 305580

Column type:
CHROMABOND® HILIC, 3 mL, 500 mg
REF 730593

Sample pretreatment: A high part of acetonitrile in the sample is recommended. Aqueous samples must be diluted with acetonitrile (recommended: water – acetonitrile (1:3, v/v)). Dioxane or THF can be used instead of acetonitrile.

Column conditioning: 1 mL water (Do not let run the column dry!)

Equilibration: 6 mL acetonitrile or the organic solvent, dilute the sample

Sample application: prepared sample is passed dropwise through the column

Column washing: if necessary 0.5–2 mL acetonitrile or the organic solvent, dilute the sample

Elution: 1–2 mL water (dependent on analyte)

Further analysis: if necessary, evaporate and redissolve in a suitable solvent; HPLC or GC

Creatinine and creatine from water: variation of the organic solvent MN Appl. No. 305590

Column type:
CHROMABOND® HILIC, 3 mL, 500 mg
REF 730593

Sample pretreatment: 250 µL of aqueous sample are diluted with 750 µL tetrahydrofuran, 1,4-dioxane or acetonitrile

Column conditioning: 1 mL water (Do not let run the column dry!)

Equilibration: 5 mL tetrahydrofuran, 1,4-dioxane or acetonitrile

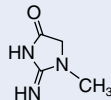

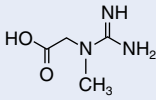

Sample application: prepared sample is passed dropwise through the column

Column washing: 3 x 1 mL tetrahydrofuran, 1,4-dioxane or acetonitrile

Elution: 1 mL water

Further analysis: HPLC with NUCLEODUR® HILIC according to MN Appl. No. 122990 (injection volume: 5 µL)

Recovery rates [%]

CHROMABOND® SA benzenesulfonic acid cation exchanger based on silica (SCX)

★ Key features

- Adsorbent with hydrophobic and π-π interactions (benzene ring)
- Ion exchange of organic compounds from aqueous matrix
- Elution of interesting compounds with solvent systems, which compensate the ionic and nonpolar interactions, e.g., methanolic HCl

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 μm, specific surface 500 m²/g, pH stability 2–8, benzenesulfonic acid modified silica, strongly acidic cation exchanger (capacity ~ 0.5 meq/g)

✓ Recommended application

- Amino acids, amines, chlorophyll, PCBs

Sulfonamides in meat and kidney

MN Appl. No. 302710

B. Pacciarelli et al., Mitt. Gebiete Lebensm. Hyg. 82 (1991) 45–55

Compounds investigated:

sulfaguanidine, sulfanilamide, sulfadiazine, sulfathiazole, sulfapyridine, sulfamerazine, sulfamethizole, sulfadimidine, sulfamethoxypyridazine, sulfachlorpyridazine, sulfadoxine, sulfadimethoxine

Column type:

CHROMABOND® SA (= SCX), 3 mL, 500 mg
REF 730077

Sample pretreatment: homogenize 10 g sample and 60 mL dichloromethane – acetone (1:1, v/v) for 30 s with a Polytron. Centrifuge the homogenate for 10 min at 2500 rpm. Filter the organic phase and wash the filter residue with a little dichloromethane – acetone. Add 5 mL glacial acetic acid to the filtered extract.

Column conditioning: apply 6 mL hexane and suck air until the column is dry (10 min). Then apply 6 mL dichloromethane – acetone – glacial acetic acid (10:10:1, v/v/v). Now the column must not run dry.

Sample application:

1/10 of the extract volume, flow rate about 2 mL/min; the column must not run dry

Column washing: 5 mL water, then 5 mL methanol; dry for 10 min under vacuum. Now suck NH₃ gas through the column until the acid is neutralized. To control the neutralization process, press air through the column: a wet pH paper should indicate a neutral or basic pH value.

Elution: 3 mL methanol (1–2 mL/min); carefully concentrate the eluate on a rotation evaporator (40 °C/100 mbar), dissolve the residue in 0.5 mL of 5.5% acetonitrile in buffer (1.641 g sodium acetate in 1 L water, adjusted to pH 5 with glacial acetic acid) and centrifuge.

Further analysis: HPLC

CHROMABOND[®] SB quaternary ammonium anion exchanger based on silica (SAX)

★ Key features

- Not suited for very strong anions such as sulfonic acids because these are difficult to elute

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8, silica modified with quaternary amine, strongly basic anion exchanger (capacity ~ 0.3 meq/g)

✓ Recommended application

- Organic acids, caffeine, saccharin

Vitamins: folic acid from food (e.g., wheat germs)

MN Appl. No. 300650

 Column type:
CHROMABOND[®] SB (= SAX), 3 mL, 500 mg
REF 730079

Sample pretreatment: homogenize 10 g food sample in 100 mL 0.01 mol/L phosphate buffer pH 7.4 and filter

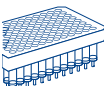

Column conditioning: 2 column volumes *n*-hexane, then 2 column volumes methanol, finally 2 column volumes dist. water

Sample application: force or aspirate 10 mL of the filtrate through the column

Column washing: 2 column volumes dist. water

Elution: 5 mL 10% sodium chloride in 0.1 mol/L sodium acetate buffer

CHROMABOND® Drug special silica phase for drug analysis

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8
- Special bifunctional modification - C₈: RP interaction
SA: strong cation exchanger / benzenesulfonic acid

✅ Recommended application

- Enrichment of acidic, neutral and basic drugs from urine or plasma

Drugs from blood serum

MN Appl. No. 302020

W. Weinmann, M. Renz, C. Pelz, P. Brauchle, S. Vogt, S. Pollak, Blutalkohol 35 (1998), 1–9

Compounds investigated: benzoylcegonine, amphetamine, codeine, morphine

📏 Column type:

CHROMABOND® Drug, 3 mL, 200 mg

REF 730168

Sample pretreatment: 0.1 mL blood serum are mixed with 1.4 mL of a 0.1 mol/L KH₂PO₄ buffer (pH 6) and centrifuged

Column conditioning: 2 mL methanol, then 2 mL 0.1 mol/L KH₂PO₄ buffer (pH 6)

Sample application: slowly force or aspirate the supernatant from the sample pretreatment through the column

Column washing: 2 mL 0.1 mol/L KH₂PO₄ buffer (pH 6), then 1 mL 0.1 mol/L acetic acid, then 2 mL methanol; finally dry the column first by centrifugation (2 min, 4000 U/min), then under vacuum for 10 min

Elution: 1.5 mL dichloromethane – 2-propanol – 25 % ammonia solution (80:20:2, v/v/v)

Further analysis: HPLC with NUCLEOSIL® 100-5 C₁₈ AB

(application 110240) or GC/MS after derivatization with perfluoropropanoic acid pentafluoropropanol, e.g., with column OPTIMA® 5 MS, 0.25 µm film, 30 m x 0.25 mm ID, (REF 726220.30)

CHROMABOND® Drug II extraction of THC and derivatives, acidic analytes from biological fluids (urine, blood, etc.)

★ Key features

- Two primary retention mechanisms facilitate use of very strong interferant-eluting solvents, resulting in very pure extracts

🔧 Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2-8
- Special bifunctional modification - C₈: RP interaction
SB: strong anion exchanger/quaternary amine -NR₃⁺

✓ Recommended application

- Extraction of THC and derivatives from urine, blood, serum, plasma
- Acidic analytes from biological fluids

11-nor-Δ⁹-THC-carboxylic acid from urine

MN Appl. No. 303880

Compounds investigated: tetrahydrocannabinol, 11-nor-Δ⁹-THC-carboxylic acid

Column type:

CHROMABOND® Drug II, 3 mL, 200 mg
REF 730680

Sample pretreatment:

add 300 µL 10 mol/L potassium hydroxide solution and internal standard (for GC/MS deuterium labeled 11-nor-Δ⁹-THC-carboxylic acid) to 5 mL urine. Vortex the sample and then hydrolyze at 60 °C for 15 min. Cool sample and add 200 µL glacial acetic acid and 2 mL 50 mmol/L ammonium acetate solution. If necessary, adjust sample pH to 6-7.

Column conditioning:

2 mL methanol, 2 mL dist. water; equilibrate column with 2 mL 50 mmol/L ammonium acetate buffer

Sample application: slowly force or aspirate the sample through the column (1-2 mL/min)

Column washing: elute interferants with 10 mL methanol – water (1:1, v/v); dry the column for 10 min at high vacuum; further wash the column with 2 mL acetonitrile and dry for another 2 min

Elution: elute THC metabolites with 3 mL hexane – ethyl acetate – glacial acetic acid (75:25:1, v/v/v)

Recovery rates: 70-80 %

Further analysis: we recommend GC/MS on an OPTIMA® 5 MS column after derivatization with 50 µL Silyl-991 (REF 701480; BSTFA – TMCS 99:1) at 70 °C for 20 min; inject 1-2 µL onto the GC column.

CHROMABOND® Tetracycline special phase for enrichment of tetracyclines

★ Key features

- Silica phase with special C₁₈ modification, tested for tetracyclines
- Constant recovery rates for the title compounds (every batch individually tested)

✓ Recommended application

- Tetracyclines from biological samples

Tetracyclines from musculature

MN Appl. No. 302030

Private communication of Mr. Lippold, Chemisches Landesuntersuchungsamt (Chem. Research Agency) Freiburg, Germany

Compounds investigated: tetracycline, oxytetracycline, chlorotetracycline (100–500 mg/kg)

Column type:

CHROMABOND® Tetracycline, 6 mL, 500 mg
REF 730315

Sample pretreatment: see detailed description in appl. 302030 at www.mn-net.com/apps

Column conditioning: 1 column volume methanol, 1 column volume dist. water, then 1 column volume EDTA – succinate buffer

CAUTION: DO NOT LET THE COLUMN RUN DRY!

Sample application: force or aspirate 50 mL of the eluate from the sample pretreatment through the CHROMABOND® column

Column washing: 2 mL dist. water (removal of Cu ions), 2 mL *n*-hexane

Elution: 7.5 mL methanol into a 25-mL tapered flask. Add 1 mL of an ethylene glycol – methanol mixture (22 g ethylene glycol filled up to 100 mL with methanol) and evaporate to dryness with a rotation evaporator (max. 40 °C). Fill up the residue to 400 mL with 0.1 mol/L McIlvain-EDTA buffer (52.5 g citric acid · H₂O, 44.5 g Na₂HPO₄ · H₂O and 93 g Titriplex III dissolved in 2.5 L dist. water, adjusted to pH 4 with NaOH).

Recovery rates: tetracycline, chlorotetracycline ~50–70 %, oxytetracycline ~60–80 %

Further analysis: HPLC with column 250 x 4 mm NUCLEOSIL® 100-5 C₁₈ HD (application 110710))

CHROMABOND® HR-P-AOX AOX from waters with high salt loads (DIN 38409 – H22)

Technical characteristics

- Special PS/DVB phase

Recommended application

- Extraction of AOX (adsorbable organically bonded halogens) from waters containing high salt loads or organic pollutants in accordance with DIN 38409 – H22

AOX from water (DIN 38409 – H22)

MN Appl. No. 302080

Column type:
CHROMABOND® HR-P-AOX, 6 mL, 500 mg
REF 730111.AOX

Column conditioning: 5 mL methanol, 10 mL dist. water
Do not let the column run dry!

Sample application: force or aspirate 100 mL original or diluted sample (pH 1) through the column (3–5 mL/min). Do not let the column run dry!

Column washing: 50 mL nitrate rinsing solution (dissolve 17 g NaNO₃ in 100 mL dist. water, add 1.4 mL HNO₃ 10 mol/L, fill up to 1000 mL; take 50 mL and fill to 1000 mL with dist. water). Discard the flowthrough.

Elution: slowly aspirate 1 x 1 mL, then 1 x 4 mL methanol and 10 mL dist. water through the column.

Collect eluates in 100 mL volumetric flask and fill to 100 mL with dist. water.

CHROMABOND® C₁₈ PAH octadecyl silica for PAH analysis

Technical characteristics

- Base material silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8
- Special octadecyl modification for the enrichment of PAHs, not endcapped, carbon content 14 %

Recommended application

- PAHs from water

PAHs from water

MN Appl. No. 301250

Column type:
CHROMABOND® C₁₈ PAH, 6 mL, 2 g
REF 730166

Sample pretreatment: mix 1000 mL water sample with 10 mL methanol
Column conditioning: 1 column volume methanol, then 1 column volume dist. water

Sample application: aspirate 1000 mL water sample through the column (~ 15–20 mL/min), then dry column (stream of nitrogen or 24 h in a desiccator over P₂O₅)

Elution: elute with 4 mL acetonitrile – benzene (3:1, v/v) and then evaporate or fill up to the volume required

Recovery rates (50 ng/L per component): Naphthaline 87 %, Acenaphthylene 89 %, Acenaphthene 90 %, Fluorene 82 %, Phenanthrene 85 %, Anthracene 90 %, Fluoranthene 89 %, Pyrene 89 %, Benz[a]anthracene 87 %, Chrysene 95 %, Benzo[b]fluoranthene 91 %, Benzo[k]fluoranthene 89 %, Benzo[a]pyrene 90 %, Dibenz[ah]anthracene 97 %, Benzo[ghi]perylene 91 %, Indeno[1,2,3-cd]pyrene 96 %

CHROMABOND® NH₂/C₁₈ combination phase for PAH analysis

★ Key features

- Special combination phase:
Aminopropyl phase for removal of interfering humic acids
octadecyl phase for the enrichment of PAHs

☑ Recommended application

- PAHs from water containing humic acids

PAHs from water containing humic acids

MN Appl. No. 301260

Column type:

CHROMABOND® NH₂/C₁₈, 6 mL, 500 mg/1 g glass column
REF 730620G

Sample pretreatment: mix 500 mL water sample with 25 mL 2-propanol
Column conditioning: 10 mL dichloromethane, 10 mL methanol, then 10 mL
dist. water – 2-propanol (9:1, v/v)

Sample application: aspirate 500 mL prepared water sample through the
column (~ 5 mL/min)

Column washing: 2 mL dist. water – 2-propanol (9:1, v/v), then dry column
(about 20 min, vacuum)

Elution: 4 x 0.5 mL CH₂Cl₂ (let percolate first 0.5 mL into the column packing
without vacuum, then apply light vacuum), if necessary evaporate in a stream
of N₂ and fill up with a suitable solvent

CHROMABOND® CN/SiOH combination phase for PAH analysis

★ Key features

- Cyanopropyl phase for selective adsorption of polycyclic
aromatics via π-π interactions
- Unmodified silica phase for removal of polar compounds

☑ Recommended application

- Extraction of the 16 PAHs according to EPA from soil
samples

PAHs from soil

MN Appl. No. 301310

Column type:

CHROMABOND® CN/SiOH, 6 mL, 500/1000 mg
REF 730135

Sample pretreatment: dry 30 g soil with sodium sulfate and reflux 4 h with
250 mL petroleum ether in a Soxhlet extractor. For low PAH contents (color-
less or weakly colored extracts) concentrate extract to 1/10 of its volume in a
rotation evaporator.

Column conditioning: 4 mL petroleum ether

Sample application: aspirate 20 mL of the extract through the column
Column washing: 2 mL petroleum ether

Elution: 2 x 2 mL acetonitrile – toluene (3:1, v/v), then evaporate or fill to the
volume required

Further analysis: HPLC, e.g., with column 100 x 4 mm NUCLEODUR® C₁₈
PAH, 3 μm, REF 760783.40 according to application 123820 (see page 227)

CHROMABOND® Na₂SO₄/Florisil® hydrocarbons from water in accordance with DIN H-53 / ISO DIS 9377-4

★ Key features

- Special combination phase of sodium sulfate and Florisil®

✓ Recommended application

- Hydrocarbons from drinking, surface and waste waters

Hydrocarbons from water

MN Appl. No. 302090

Column type:
CHROMABOND® Na₂SO₄/Florisil®, 6 mL, 2 g/2 g glass column
REF 730249G

Internal standard solution: dissolve 20 mg *n*-tetracontane (C₄₀H₈₂) in petroleum ether, add 20 mL *n*-decane (C₁₀H₂₂) and fill up to one liter with petroleum ether. For the preparation of the extraction solution dilute standard solution 1:10 with petroleum ether.

Sample pretreatment: adjust 900 mL water (10 °C) with HCl (12 mol/L) to pH 2 and add 80 g MgSO₄. Add 50 mL of the extraction solution, close the bottle and stir the suspension intensely for 30 min. Add enough dist. water to separate the organic from the aqueous phase.

Column conditioning: 5 mL petroleum ether

Sample application: slowly aspirate or force the sample through the column

Elution: wash with 10 mL petroleum ether. Evaporate the combined solution from sample application and elution to 1 mL at about 75 °C. If necessary, fill up to 1 mL again. (If the hydrocarbon content is high, evaporation to 1 mL may not be necessary.)

Recovery rates: must be > 80 % for *n*-tetracontane

CHROMABOND® NAN special phase for PCB analysis

★ Key features

- N: sodium sulfate for removal of trace water
- A: SiOH/AgNO₃ phase for removal of sulfur, sulfur-containing and polar compounds

✓ Recommended application

- Extraction of PCBs from sludge

PCB from sludge

MN Appl. No. 301400

Compounds investigated: polychlorinated biphenyls (PCB)
This method can also be used for soil samples.

Column type:
CHROMABOND® NAN, 6 mL, 700/2000/700 mg
REF 730149

Sample pretreatment:
extract 2 g lyophilized sludge with 70 mL *n*-hexane, evaporate extract and fill to 10 mL with *n*-hexane

Column conditioning: 10 mL *n*-hexane

Sample application: aspirate 2 mL extract into the column

Elution: slowly aspirate 40 mL *n*-hexane through the column with light vacuum, then evaporate and fill to 5 mL with *n*-hexane

Recovery rates: PCB-28 104 %, PCB-52 100 %, PCB-101 99 %, PCB-138 98 %, PCB-153 101 %, PCB-180 98 %, PCB-209 104 %

CHROMABOND® SA/SiOH combination phase for PCB analysis

★ Key features

- SA: strongly acidic cation exchanger based on silica with benzenesulfonic acid modification
- SiOH: unmodified silica for removal of polar compounds

✓ Recommended application

- Extraction of PCBs from waste oil (hexane extract)

PCB from waste oil MN Appl. No. 301390

Column type:
CHROMABOND® SA/SiOH, 3 mL, 500/500 mg
REF 730132

Column conditioning: 1 mL *n*-hexane

Sample application: apply 250 µL waste oil sample to the column and aspirate or force it into the adsorbent with 2 x 1 mL *n*-hexane

Elution: aspirate or force another 2 x 500 µL *n*-hexane through the column; collect all *n*-hexane fractions and if necessary adjust concentration for subsequent analysis by either evaporating *n*-hexane in a stream of nitrogen or by dilution with *n*-hexane

Recovery rates: PCB-28 97 %, PCB-52 96 %, PCB-101 95 %, PCB-138 90 %, PCB-153 95 %, PCB-180 96 %, PCB-209 100 %

PCBs can be separated successfully with e.g., OPTIMA® XLB (see page 317).

CHROMABOND® SiOH-H₂SO₄/SA combination phase for PCB analysis

★ Key features

- SiOH-H₂SO₄: H₂SO₄-impregnated silica phase for oxidation of accompanying compounds to ionic and/or polar compounds
- SA: strongly acidic cation exchanger based on silica with benzenesulfonic acid modification for removal of ionic and sulfur-containing compounds
- This combination column is used together with a SiOH column. Both columns together are available as Kombi-Kit PCB.

✓ Recommended application

- Extraction of PCBs from oil with reference to German industrial standard DIN 51527, part 1

PCB in oil samples

MN Appl. No. 301380

determination with reference to German industrial standard DIN 51527

Column type:

CHROMABOND® SiOH-H₂SO₄/SA, 3 mL, 500/500 mg and
 CHROMABOND® SiOH, 3 mL, 500 mg
 REF 730085 and 730073
 or Kombi-Kit PCB, REF 730125

Sample pretreatment: extract oil-contaminated solids with *n*-hexane. Homogenize other oil samples and dissolve 1.5 to 2.0 g in 50 mL *n*-hexane. Water which may cause turbidity can be removed with sodium sulfate.

Column conditioning: let 1 mL *n*-hexane flow through the CHROMABOND® SiOH-H₂SO₄/SA column

Sample application: aspirate or force 500 µL sample through the CHROMABOND® SiOH-H₂SO₄/SA column. This phase offers better removal of interfering substances due to sulfonation. Place CHROMABOND® SiOH-H₂SO₄/SA column on top of the SiOH column with the aid of an adapter and after at least 30 s flush sample into the SiOH column with 2 x 1 mL *n*-hexane.

Elution: elute SiOH column with 3 x 0.5 mL *n*-hexane; adjust to a suitable concentration for subsequent GC analysis by evaporation of *n*-hexane in a stream of nitrogen or by dilution with *n*-hexane

Recovery rates: PCB-28 99 %, PCB-52 95 %, PCB-101 99 %, PCB-138 94 %, PCB-153 99 %, PCB-180 96 %, PCB-209 101 %

CHROMABOND® QuEChERS special silica phase for determination of pesticides in food samples

★ Key features

- Reliable CHROMABOND® adsorbents
- Different packaging with mixes for all established methods
- Convenient to use - pre-weighed and mixed
- Saves time and money
- Increases efficiency in the laboratory
- Individual combination of mixes on request

✓ Recommended application

- Special SPE phase for quick and cheap determination of pesticides in strongly matrix-contaminated samples by GC or HPLC
- QuEChERS methode =
Quick Easy Cheap Effective Rugged Safe

CHROMABOND® Diamino special silica phase for determination of pesticides in food samples

★ Key features

- Base material silica, pore size 60 Å
- Removes polar compounds (e.g., organic acids, pigments, sugars) from matrices like fruit or vegetables

🔧 Technical characteristics

- Particle size 45 µm, specific surface 500 m²/g, pH stability 2–8
- Primary and Secondary Amine functions (PSA), 5 % C

Similar phases

- Supelclean™ PSA, Bond Elut® PSA

Food analysis

QuEChERS methods and ready-mixes

Within a few years after its development by Anastassiades et al. [1] the QuEChERS method has gained a leading position for determination of pesticide residues in food samples by GC-MS or LC-MS, allowing rapid and cheap clean-up of strongly matrix-contaminated samples.

Advantages of QuEChERS in comparison with classical clean-up methods:

- High through-put, due to easy handling and time-saving procedure
- Low consumption of solvents
- No need for chlorinated solvents
- Suitable for a variety of pesticides
- Rugged method with high and safe recovery rates
- Broad applications for various foods

To optimize the extraction of pH-dependent compounds, to minimize decomposition of sensitive substances, and to broaden the matrix spectrum, different modifications of the QuEChERS method have been elaborated. These mixes differ in the type of buffer agent used and in this way the resulting pH value of the aqueous sample during the extraction vary.

Today three methods are used:

- Original (non-buffered) [1]
- AOAC Standard 2007.1 (acetate buffered) [2]
- EN 15662 (citrate buffered) [3]

In particular the buffered versions are commonly used.

All methods require two proceeding steps:

- Extraction: pesticides are transferred from the aqueous to the organic layer (often acetonitrile)
- Clean-up: Interfering substances (like e.g., lipids, pigments), which were also extracted with the organic layer, are removed by special adsorbents

Analysis: Sample is analyzed by GC-MS or LC-MS/MS

The QuEChERS procedure is described in the following in accordance with EN 15662:2008. An extraction mix and a clean-up mix is required.

Step 1 – Extraction and salting-out

1. Homogenize sample (e.g., with dry ice in a blender)
2. Weigh 10 g of the sample into a centrifuge tube
3. Add 10 mL of acetonitrile and internal standard
4. Shake vigorously for 1 minute
5. Add extraction mix to centrifuge tube
Optional: check pH and adjust pH to 5.0–5.5 with 5 mol/L aqueous NaOH.
6. Shake vigorously for 1 minute
7. Centrifuge for 5 minutes at > 3000 g. For the determination of pesticides with acidic groups, the raw extract should be analyzed directly (preferably by LC/MS ESI neg.)

Step 2 – Clean-up

1. Transfer an aliquot of the supernatant to a centrifuge tube containing a clean-up mix
2. Shake for 30 seconds
3. Centrifuge for 5 minutes at > 3000 g

Analysis

Transfer supernatant to vial, acidify with 5 % formic acid in acetonitrile (10 µL/mL extract) and analyze the sample by LC-MS or GC-MS. MACHEREY-NAGEL offers a variety of pre-weighed and mixed extraction and clean-up mixes, which are in accor-

dance with the above mentioned standardized methods, specially adapted to the different sample matrices. These matrices differ in their characteristics e.g., low or high fat content or different amounts of pigments.

If you require an individual mix, which differs in the composition from the below mentioned mixes, please contact us.

Additional MACHEREY-NAGEL offers the reliable adsorbent CHROMABOND® Diamino (PSA) as bulk material.

The following table provides guidance for the choice of different QuEChERS mixes:

Step 1 – Extraction and salting-out

Method	Sample weight	Solvent	Content of mix	Mix
EN 15662:2008, citrate-buffered [2]	10 g	10 mL acetonitrile	4 g MgSO ₄ , 1 g NaCl, 0.5 g Na ₂ H citrat · 1.5 H ₂ O, 1 g Na ₃ citrat · 2 H ₂ O	Mix I
AOAC 2007.01, acetate-buffered [3]	15 g	15 mL 1 % acetic acid in acetonitrile	6 g MgSO ₄ , 1.5 g NaOAc	Mix II
Original non-buffered [1]	10 g	10 mL acetonitrile	4 g MgSO ₄ , 1 g NaCl	Mix XII

Step 2 – Clean-up

Sample property	Content of mix	EN 15662	AOAC 2007.01
Low fat content e.g., apple, asparagus, broccoli, pear, pineapple, strawberry	MgSO ₄ Diamino (PSA)	Mix III	Mix XX
Moderate content of chlorophyll and carotinoids e.g., carrot, lettuce	MgSO ₄ Diamino (PSA) Carbon	Mix IV	Mix XVII
Higher content of chlorophyll and carotinoids e.g., pepper, spinach, blackberry, raspberry	MgSO ₄ Diamino (PSA) Carbon	Mix V	–
Higher fat content e.g., avocado, cereals, nuts, beef, chicken, pork, dairy products, soil, oils, baby food	MgSO ₄ Diamino (PSA) C ₁₈ ec	Mix VI	Mix XIX

Adsorbents and what they are used for

MgSO ₄	removes excess of water
NaCl	for phase separation
CHROMABOND® Diamino (PSA) (Primary Secondary Amine)	removes organic and fatty acids, sugars and anthocyanin pigments
CHROMABOND® C ₁₈ ec (reversed phase modified silica)	traps nonpolar compounds, e.g., lipids
CHROMABOND® Carbon (GCB) (Graphitized Carbon Black)	removes pigments and sterols (please note: planar pesticides are also removed)

CHROMABOND® ABC18 special phase for analysis of acrylamide in food

★ Key features

- Octadecyl silica phase with ion exchange functions for acrylamide analysis

✓ Recommended application

- Clean-up of acrylamide from ultra-heated starch-containing food, such as potato chips and other snacks, french fries, crispbread, cereals etc.

Ordering information

	Volume	Adsorbent weight → 500 mg	Pack of
		CHROMABOND® ABC18 polypropylene columns 6 mL	730533

Important notes

- For “Determination of Acrylamide in Foods, SPE Clean-up Procedure for LC-MS/MS” please see application 303580 at www.mn-net.com/apps
- Acrylamide is created at temperatures above 100 °C from sugar and proteins, e.g., from potatoes or grain during the process of frying, baking, roasting or grilling. The formation depends on temperature, starting at 120 °C and increasing with more elevated temperatures. In cooked food, no acrylamide is found.
- Minimum concentration of acrylamide should be 70 µg/kg.
- The procedure includes no concentration step.
- Acrylamide and the isotopically labeled form, is carcinogenic, mutagenic and neurotoxic.

CHROMABOND® Carbon A

✚ Technical characteristics

- Base material activated carbon, highly porous, spherical particles, specific surface >1000 m²/g

✓ Recommended application

- Acrylamide from water according to DIN 38413-6 (e.g., application 306140)

Enrichment of acrylamide from water acc. to DIN 38413

MN Appl. No. 306140

Column type:

CHROMABOND® Carbon A, 6 mL, 1000 mg
REF 730167

Sample pretreatment: A drinking water sample was taken according to DIN 38402. The sample was treated with 100 mg/L sodium thiosulfate pentahydrate to reduce oxidizing species. 40 mg/L sodium azide was then added to avoid microbiological degradation. An aliquot of 500 mL pretreated water sample was spiked with 50 ng acrylamide.

Column conditioning: 8 mL methanol and 8 mL water

Sample application: sample was aspirated at a flow of 20 mL/min

Column washing: 1 mL water

Drying: 15 min nitrogen or air flow

Elution: 5 x 2 mL methanol

Concentration: eluate was concentrated to 1 mL by heating at 40 °C under a slight nitrogen stream

Recovery rates: 81 % (SD: 5 % [n=6])

Further analysis: HPLC-MS/MS in reference to appl. no. 127530

CHROMABOND® PL special phase for removal of phospholipids

★ Key features

- CHROMABOND® PL products are designed for internal protein precipitation. External protein precipitation could be necessary in order to prevent upper frit adsorbent bed clogging.

✓ Recommended application

- Removal of phospholipids
- Standard protocol see application 306110

Standard protocol for removal of phospholipids with internal protein precipitation

MN Appl. No. 306110

Column type:

CHROMABOND® PL, 1 mL, 30 mg, REF 730703 or
CHROMABOND® Multi 96 PL, 96 x 30 mg, REF 738702.030M

Column conditioning: none

Sample application: add up to 100 µL sample onto column / into well
Protein precipitation (internal): add protein precipitation reagent (e.g., final ratio of 3:1 to 4:1 of 1 % formic acid in acetonitrile : sample)

Mixing: mix thoroughly, avoiding cross contamination

Sample collection: slowly elute using vacuum or positive pressure

CHROMABOND® PTS and PTL PTS and PTL columns for phase separation

★ Key features

- Automatic separation of a two-phase mixture without separation funnel
- Two-phase mixtures are completely applied to the column and the phase boundary is determined without further work. The special membrane automatically stops the flow when the lower phase has passed. The upper phase remains in the column, thus both phases are available for further analysis.
- Columns must not be run with vacuum or pressure

✓ Recommended application

- PTS: for solvents heavier than water, e.g., trichloromethane, dichloromethane maximum size 150 mL
- PTL: for solvents lighter than water, e.g., diethyl ether, hexane maximum size 70 mL

Ideal tool for breaking emulsions

CHROMABOND® PTL in action: organic upper phase (colorless), aqueous lower phase (red)

CHROMABOND® XTR for liquid-liquid extraction

★ Key features

- Base material coarse-grained kieselguhr (also known as diatomaceous earth, hydromatrix, celite), large pore size, high pore volume, constantly high batch-to-batch quality, pH working range 1–13
- Advantages:
 - Fast, reproducible and economical
 - Simultaneous preparation of several samples
 - No problems with phase separation
 - No formation of emulsions
 - High recovery rates
 - Saving of time and solvents
 - Organic solutions need not to be dried after separation

✓ Recommended application

- Liquid-liquid extraction of highly viscous aqueous solutions such as physiological fluids (blood, plasma, and serum) in clinical chemistry, dyes in textiles, environmental and food analysis without use of a separation funnel
- High water loadability without breakthrough of water during elution with organic solvents also suited for removing small amounts of water from solvents which are not miscible with water

Solvents applicable for elution

- Diethyl ether
- *tert* butyl methyl ether
- Ethyl acetate
- *n*-hexane
- Cyclohexane
- Toluene
- Dichloromethane (methylene chloride)
- Trichloromethane (chloroform)
- Trichloromethane – methanol (90:10, v/v)
- Trichloromethane – methanol (85:15, v/v)
- Diethyl ether – ethanol (90:10, v/v)
- Diethyl ether – ethanol (80:20, v/v)
- Dichloromethane – 2-propanol (90:10, v/v)
- Dichloromethane – 2-propanol (85:15, v/v)

Eluents with too high alcohol contents cause an increase in volume of the aqueous phase on the CHROMABOND® XTR. Here the column could be overloaded and the aqueous phase displaced from the column. In this case, a greater capacity column should be used.

Depending on the concentration of the analytes eluates can be analyzed immediately, or the organic solvent is evaporated. The pH value of the aqueous solution can be altered on the column, which enables elution of different compounds of a sample under optimized conditions. Under certain circumstances, acidic, neutral, and basic compounds can be fractionated in this way.

General column parameters

150 mL	37.5 g	50 mL	10–15 min	90 mL

Determination of azo dyes and aromatic amines in colored textile materials with reference to § 64 LFGB (formerly § 35 LMBG)

MN Appl. No. 302100

Column type:

CHROMABOND® XTR, 70 mL, 14.5 g, for max. 20 mL aqueous solution
REF 730507

Sample pretreatment: Weigh about 1 g cut-up textile sample (colored textiles about 0.1 g) in a 100 mL threaded vial. (Degrease leather samples before processing: cover sample with technical purity *n*-hexane and put the vial in an ultrasonic bath for 20 min. After decanting the *n*-hexane rinse with little *n*-hexane and dry sample by gentle heating and blowing with air or N₂).

Add 250 µL internal standard (IS: 1.2 mg/mL tetramethylbenzidine in methanol – ethyl acetate (1:1, v/v)), 17.0 mL citrate buffer (pH 6) (25.05 g citric acid and 12.64 g NaOH, fill up with deionized water to 2 L) and heat 30 min at 70 °C.

Then add 3 mL of a freshly prepared solution of 0.2 g/mL sodium dithionite in water and heat for exactly 30 min to 70 °C while shaking occasionally.

Sample application: Cool the solution immediately (put vial in water – stopping of reductive cleavage). After 5–10 min pour it onto the CHROMABOND® XTR column (squeeze textile remains).

Elution: Allow solution to be soaked up by the adsorbent for 15 min. Then elute four times with 20 mL each of diethyl ether or diethyl ether – ethanol (90:10, v/v) (depending on recovery rates), using the first 40 mL to rinse the sample remains.

Evaporate eluates to 3 mL with a rotation evaporator and transfer the solution into a 10 mL measuring flask using a pasteur pipette and rinsing with methanol. Fill up to the marking with methanol, shake, and pipette about 1 mL into a vial.

Further analysis:

Fast GC on OPTIMA® δ-3, 10 m, 0.1 mm ID, 0.1 µm film, REF 726410.10 (application 210820) or HPLC on NUCLEOSIL® 100-5 C₁₈ HD (application 110500 at www.mn-net.com/apps)

variable polypropylene rack for 24 positions, incl. 24 PP stopcocks and 24 PP needles

730508

For parallel processing of up to 24 CHROMABOND® XTR columns 1–150 mL we recommend the polypropylene rack REF 730508 consisting of: two side walls, middle part including stopcocks and needles, bottom part, top part for stabilizing 45 mL and 70 mL CHROMABOND® XTR columns.

This rack can be adjusted to various heights depending on the CHROMABOND® XTR columns and the collection vials used.

Each position of the middle part is equipped with a polypropylene stopcock on the top (REF 730185) and a polypropylene needle on the bottom (REF 730154).

For collection of the sample, vessels such as vials, test tubes, round bottom or tapered flasks, can be used. For our program of sample vials, please see the chapter “Vials and accessories” from page 97.

For further applications on CHROMABOND® phases visit our online application database at www.mn-net.com/apps

CHROMABOND® Vacuum manifold

★ Key features

- For the simultaneous preparation of up to 12, 16 or 24 samples
- Replacement parts and accessories for special applications

Vacuum manifold for 12 columns

- ① Rectangular glass cabinet; 2 sizes available: small for up to 12 CHROMABOND® columns or CHROMAFIX® cartridges; large for up to 16 CHROMABOND® LV columns or up to 24 CHROMABOND® columns or CHROMAFIX® cartridges (depending on lid)
- ② Polypropylene lid
- ③ Vacuum gauge for pressure reading
- ④ Control valve for adjustment of vacuum
- ⑤ Replaceable valves for vacuum control of individual SPE columns
- ⑥ Variable rack with exchangeable partitions, which accept a wide variety of vessels like test tubes, measuring flasks, scintillation vials, autosampler vials, plastic vials etc.
- ⑦ CHROMABOND® LV columns with 15 mL sample reservoir for medium size samples
- ⑧ Polypropylene sample reservoirs (30 or 70 mL)*
- ⑨ Adapter for sample reservoirs*
- ⑩ CHROMABOND® tubing adapters

Full description and manual can be downloaded at www.mn-net.com

Protection from cross contamination

For special applications which require maximum protection from cross contamination we supply chrome-plated brass valves and stainless steel or PTFE connectors. Their application is shown on the right side. These special connectors are fitted through the lid; thus the sample only has contact with the inert connector and can flow directly into the receptacle.

Drying attachment

If the eluate has to be evaporated, this can be performed with the so-called drying attachment ⑪. This special lid has a gas connector ⑫ on one side, from which the gas is fed simultaneously to the 12, 16, or 24 stations ⑬. Thus 12, 16, or 24 eluates can be evaporated simultaneously by just changing the lid and applying a stream of inert gas, e.g., nitrogen.

Automated and on-line SPE

Performing Solid Phase Extraction (SPE) manually can be time consuming and nerve-racking, especially when recovery and reproducibility are lacking due to sample variability. If SPE can be reliably automated it becomes a much more efficient and reproducible process.

On-line SPE is a powerful method in automated sample preparation where the SPE hardware is technically integrated into a HPLC system. Crude samples are placed in an autosampler and processed fully automatically prior to injection into a GC (MS) or LC (MS) system.

MN offers different on-line column configurations designed to fit your on-line SPE needs and filled with a choice of different adsorbents, modifications and particle sizes:

- Ready-to-use EC columns or ChromCart® cartridges for on-line SPE (standard dimensions 20 x 2 mm or 20 x 4 mm, resp.), filled with CHROMABOND® HR-Xpert phases (15 µm particles) or with NUCLEODUR® C₁₈ ec, C₈ ec, CN (20 µm particles)

EC column

CC-cartridges

- Columns for Gilson® ASPEC™ systems are ready to use assembled with caps. In addition to the columns and phases listed below, all 1, 3 and 6 mL CHROMABOND® polypropylene columns from our program can be supplied assembled with ASP caps.

CHROMABOND® MULTI 96 for robot systems

Alternatively CHROMABOND® MULTI 96 plates provide a means of high throughput sample preparation by processing 96 samples in a standard 8 x 12 microcolumn plate format compatible with standard 96-well plate liquid handling technologies and injection systems. MULTI 96 plates are available for solid phase extraction (SPE) and for filtration (see page 95)

CHROMABOND® MULTI 96

- 96-well PP microtiter plates with PE filter elements
- Cavity volume 1.5 mL
- Adsorbent weights 10, 25, 50, 100 mg per microcolumn
- Supplied with any CHROMABOND® SPE adsorbents
- For the simultaneous preparation of 96 samples
- Easy method transfer from CHROMABOND® columns or CHROMAFIX® cartridges to CHROMABOND® MULTI 96

Advantages of this high-throughput system

- Simultaneous preparation of 96 samples; this means a 4-fold increase over traditional 24-position SPE processors
- Economical by saving time and solvent
- Use of multi-channel pipettors facilitates liquid transfer steps
- Readily adaptable to all common automated and robotic handling systems
- Minimized dead volume ($\leq 40 \mu\text{L}$)

Instrument compatibility

CHROMABOND® MULTI 96 SPE microtiter plates as well as CHROMAFIL® MULTI 96 filtration plates are compatible with, e.g., the following liquid handling and SPE automation systems:

- Perkin Elmer MultiProbe® II
- Tomtec Quadra 3® and Quadra 3® SPE
- Hamilton Microlab® SPE Workstation
- Beckman Coulter Biomek® 2000
- Caliper Life Science RapidTrace®
- Gilson® ASPEC™ XL4 and ASPEC™ XL
- Gilson® 215 SPE Liquid Handler
- Tecan Genesis™ FE500
- Eppendorf epMotion®

CHROMABOND® MULTI 96 vacuum manifold

For handling of CHROMABOND® MULTI 96 SPE plates for up to 96 samples

CHROMABOND® MULTI 96 is designed for use in common robotic workstations or commercially available liquid handling systems. Alternatively, use of multichannel pipettors facilitates a manual liquid transfer. Extraction is carried out using the CHROMABOND® MULTI 96 vacuum manifold.

With the help of the control valve the vacuum of the manifold can be adjusted leading to an optimum flow rate through the CHROMABOND® MULTI 96 SPE plate.

A reservoir tank and 96-well collection plates (96 x 0.5 or 96 x 2 mL) made of polypropylene can be supplied as accessories.

An interesting alternative for collection of the eluates is a collection rack, which can be fitted with twelve 8-well strips of polypropylene tubes (each 1 mL).

If you have to work on less than 96 samples, you can seal individual rows of the 96-well plate with a PTFE-covered rubber pad.

MN Flash adsorbents a unique variety of phases

★ Key features

- Flash columns and cartridges from MACHEREY-NAGEL are available with all CHROMABOND® SPE / Flash packings (more than 40 phases, e.g., C₁₈, C₈, OH, Alox). Additionally you can choose from our range of POLYGOPREP silica packings in particle sizes from 20 to 130 µm and pore sizes from 60 to 4000 Å.
- For high performance Flash separations spherical silica featuring very high separation efficiency can be requested

🔧 Technical characteristics

- Specification of modified and plain silica, acid-washed irregular silica, pore size 60 Å, particle size 45 µm, specific surface 500 m²/g, pH stability 2–8

Comparison of separation efficiency and price of irregular versus spherical silica

Separation efficiency and reproducibility

Our optimized automatic packing process leads to an excellent packing quality, irrespective of the phase or particle size distribution (normal phase or reversed phase, spherical or irregular particles). MACHEREY-NAGEL, as a manufacturer of silicas, has decades of experience in the production of first class separation phases and columns. This leads to highest separation efficiencies of the columns, a constant back pressure (via controlled narrow particle size distribution) and good reproducibilities from cartridge to cartridge.

The separation efficiency is in the first place not influenced by the dimension or the geometry of the Flash RS cartridges. The chromatograms below show an identical resolution and peak form for different column dimensions, when flow and sample amount is adjusted correctly. This is advantageous for optimization and upscaling experiments.

Resolution and peak shape for different column dimensions

MN TLC and Flash products

- Same selectivity and easy upscaling from TLC to Flash separations
- Saving time and money, because expensive optimizations are not required

TLC is often used for the development of a selective and reproducible method in Flash chromatography, because it is often necessary to test a large number of eluent and / or adsorbent

TLC screening

For TLC separation you should start with an unmodified silica and a nonpolar eluent of low viscosity (e.g., mixtures of *n*-hexane – ethyl acetate or *n*-hexane – acetone). By changing the composition of the eluent the R_f value of the TLC separation is adjusted to approx. 0.3. Increasing polarity of the eluent decreases the R_f

combinations. MN TLC plates and sheets are coated with the same base silica, which is used in our CHROMABOND® Flash cartridges. This is an important prerequisite for the reproducible transfer of a TLC separation to the Flash column, because the parameters are identical in both systems.

values. The difference in R_f values between the substances to be separated should be at least 0.1 to allow a reliable separation in the subsequent flash chromatography. Variation of the eluent components (e.g., acetone, dichloromethane) can be used to enhance the separation by eluent specific selectivity.

Our program of TLC plates can be found from page 273 onwards.

Technical support for Flash RS and Flash BT

Loadability

- Due to the narrow particle size distribution, the excellent packing quality and the optimized stationary phases (acid washed silica, reduced particulate matter) our cartridges can realize highest loadability at best possible separation efficiency.
- Additionally, the large range of different cartridge lengths and diameters eases to find the optimum in loadability for a given sample amount.

Rule of thumb for the loadability

Separation	Loadability	g sample / g adsorbent
difficult	low	≤ 1 %
easy	high	≥ 10 %

Loadability table CHROMABOND® Flash RS and BT

SiOH cartridge	Average loadability per cartridge [g]	
	difficult separation	easy separation
RS/BT 4	0.04	0.4
RS/BT 15	0.15	1.5
RS/BT 25	0.25	2.5
RS/BT 40	0.4	4
RS/BT 80	0.8	8
RS/BT 120	1.2	12
RS/BT 200	2	20
RS/BT 330	3.3	33
RS 800	8	80
RS 1600	16	160

Back pressure and pressure stability

The back pressure always depends on flow rate and viscosity of the eluent mixture, column length and diameter and the particle size. The high performance CHROMABOND® Flash RS cartridges up to 200 g silica are stable up to 15 bar (220 psi, > 200 g: 12 bar).

Back pressure of CHROMABOND® Flash RS SiOH cartridges (eluent hexane – ethyl acetate 9:1 or 8:2)

Flow rate	20 mL/min	40 mL/min	80 mL/min	120 mL/min	160 mL/min	200 mL/min	240 mL/min
Cartridge							
RS/BT 4	0.75 bar	1.5 bar					
RS/BT 15	0.25 bar	0.75 bar	1.5 bar	2.0 bar			
RS/BT 25	0.5 bar	1.0 bar	1.75 bar	3.0 bar	4.0 bar	5.0 bar	
RS/BT 40		0.75 bar	1.5 bar	2.25 bar	3.0 bar	3.25 bar	3.5 bar
RS/BT 80			1.5 bar	2.5 bar	3.0 bar	3.5 bar	4.0 bar
RS/BT 120			1.0 bar	1.5 bar	2.0 bar	2.5 bar	3.0 bar
RS/BT 200			1.0 bar	1.5 bar	2.0 bar	2.5 bar	3.0 bar
RS/BT 330	(typical flow rate)		1.5 bar	2.25 bar	3.0 bar	3.5 bar	4.0 bar

Conditioning volumes for CHROMABOND® Flash RS cartridges (normally 1.5 column volumes of the eluent)

Cartridge	Volume of eluent for conditioning
RS/BT 4	20 mL
RS/BT 15	60 mL
RS/BT 25	90 mL
RS/BT 40	140 mL
RS/BT 80	280 mL

Upscaling of the optimum flow rate

This depends on the eluent, the separation problem, the amount of adsorbent and also on the dimensions of the column.

In the simplest case the upscaling relation is proportional to the amount of adsorbent (for equal eluent polarity).

For the flow rate the following would apply e.g.,

4 g silica → optimum flow: ~ 6–12 mL/min

40 g silica → optimum flow: ~ 60–120 mL/min

Upscaling of the flow rate

We recommend using a pressure guard, because short time pressure peaks (viscosity of eluent or gradient changes) can exceed the pressure limit.

CHROMABOND® Flash cartridges

Ideal for Flash separations from 10 mg up to 160 g

Convenient operation and reliable upscaling; Complete program of ready-to-use Flash cartridges for:

- Isco Companion® and other Teledyne Isco CombiFlash® systems
- Biotage® Isolera™, Biotage® FlashMaster™
- Or as stand-alone version for all pump / detector combinations, e.g., from Biotage®, Büchi

Enhanced flexibility

- All common RP and NP phases available on request
- Adsorbent weights from 4 g to 1600 g (up to 300 g for BT)

Outstanding price-performance ratio

Increased analytical safety

- Low bleed polypropylene cartridges, organic solvent resistant, thick column walls, one piece body, sophisticated length-to-diameter ratio for high plate numbers and excellent separation efficiencies, optimal ratio of length and diameter
- Distribution of eluent stream via highly porous frits
- High pressure stability of 21 bar / 300 psi (15 bar for 80 g and 120 g cartridges, 12 bar for cartridges > 200 g, 7 bar for 3000 g), good reproducibility

High quality standard

- All flash cartridges and adsorbents undergo comprehensive during- and after-production quality assurance measures to ensure that the products conform to the specification.

CHROMABOND® Flash RS - pictures of CHROMABOND® Flash BT, DL and FM hardware can be found on page 15.

CHROMABOND® Flash RS solutions for Isco® Flash instruments

★ Key features

- Heavy-duty polypropylene cartridges designed for use in Teledyne Isco CombiFlash® systems (Companion®, R_f etc.) without additional connectors or capillaries.
- Column connection:
cartridges up to RS 330: female Luer lock inlet and male Luer outlet
RS 800 and RS 1600: maxi Luers

✓ Recommended application

- Using the CHROMABOND® Flash Starter Kit, REF 730798 or the CHROMABOND® Flash Stand Alone Kit, REF 732903 (see page 78) CHROMABOND® Flash RS cartridges can also be used as stand alone system with any pump / detector / fraction collector combination (except RS 800, RS 1600 and RS 3000 with maxi Luers).

- ① CHROMABOND® Flash DL cartridge filled with sample on CHROMABOND® XTR on top of CHROMABOND® Flash RS or BT silica cartridge
- ② CHROMABOND® Flash BT cartridge partly filled with silica topped with sample on CHROMABOND® XTR

Options for solid injection

The sample is dissolved in a suitable solvent and adsorbed onto CHROMABOND® XTR (diatomaceous earth, see page 63). After removal / evaporation of the residual solvent, the adsorbent

is put on top of a partly filled CHROMABOND® Flash BT cartridge or into an empty CHROMABOND® Flash DL cartridge.

Our XTR adsorbents can be found on page 63.

CHROMABOND® Flash FM solutions for FlashMaster™ instruments

★ Key features

- Column connection: open-tubular inlet and male Luer outlet

✓ Recommended application

Glass columns and accessories for Flash chromatography

★ Key features

- MN flash chromatography kits include a glass column, eluent reservoir, silica 60 and accessories. Glass columns of different sizes and accessories can be ordered separately.
- These columns are normally filled to a height of about 15 cm, working pressures are 1.5 to 2 bar.
- The most used adsorbent is silica 60 with particle size 40–63 µm (see page 259), however, you may also use our ranges of other LC adsorbents and of POLYGOPREP silica phases (see page 258). Particle sizes < 25 µm should only be used with very low-viscosity mobile phases, because otherwise flow rates will be very low.
- These columns are packed by the user.
- No expensive equipment required

✓ Recommended application

- Economic low-tech method for the synthesis laboratory
- Suited for the separation of compounds up to gram levels

Ordering information

CHROMAFIL® filtration cartridges · MULTI 96.....	94

Sample filtration

Syringe filters are used for filtration of suspended matter from liquid samples or gases. With CHROMAFIL® rapid purification and removal of particles is very simple: just place the filter on the syringe and you are ready for filtration. Special manipulations are not required. The contamination of sensitive instrumentation by solid impurities can be avoided, which leads to an increase of lifetime of chromatographic columns and equipment.

Advantages

Polypropylene housing

- Considerably better solvent stability compared to acrylate and polystyrene filters, featuring a low content of extractable substances

Lowest content of extractable substances

- The housing of every CHROMAFIL® filter is ultrasonically sealed (welded), not glued, because glue may have extractable ingredients. Welding leads to a tight connection between both parts, thus the filter can be used in both directions. The special thick rim of the housing is ideal for use in laboratory robots (e.g., SOTAX®, Benchmate™).

Luer lock on the side of entry

- For a safe connection on the high-pressure side every filter provides a Luer lock on the side of entry.

Luer exit

- For 3, 13 and 25 mm filters: standard Luer exit
- For 15 mm filters: minispike · This Luer configuration offers a low hold-up volume and easy filtration into autosampler vials and NMR tubes.
- With the aid of a special adapter, filter inlet and filter exit can be fitted to all CHROMABOND® columns and accessories for selective sample preparation.

No rupture of membrane due to the impact plate

- The input solvent stream is broken and distributed by the impact plate and does not directly hit the membrane: this prevents rupture of the membrane. The high pressure stream is diverted into four lanes.

Optimum flow geometry because of the starshaped distribution device

- The stream of liquid is broken into 4 lanes by the impact plate and then further distributed to 8 slots in the form of a star connected with 5 or 8 circular channels (for 13, 15 and 25 mm filters, respectively). Thus, the fluid is able to penetrate the membrane on the whole surface, not only on a small region; the filter is not plugged up rapidly, which results in a high-flow efficiency.

Color coded filters

- Filters with 0.2 µm pores have a yellow upper shell, that of filters with 0.45 µm pores is colorless; the different membrane types are distinguished by different colors of the lower shell.

Different pore sizes for versatile filtration

- Standard pore sizes 0.2 and 0.45 µm (additionally: PET filters with 1.2 µm, glass fiber filters with 1 µm, PES filters with 5 µm). Filters with 0.45 µm pore size efficiently remove fine particles that can plug chromatography columns. Filters with 0.2 µm pore size are excellent for filtration of UHPLC samples or other techniques requiring high purity samples.

Filter sizes

- 3, 13, 15 and 25 mm diameter: the small diameter filters are especially recommended for very small samples, which require extremely low dead volumes: 5 µL for 3 mm Ø, 30 µL for 13 mm Ø, 35 µL for 15 mm Ø, 80 µL for 25 mm Ø

Recommended filter size depending on sample volume

Sample volume	Recommended filter diameter
≤ 1 mL	3 mm
1–5 mL	13 mm, 15 mm
5–100 mL	25 mm

Filters can be autoclaved at 121 °C, 1.1 bar for 30 min.

All 25 mm CHROMAFIL® filters are designed to be 100 % compatible and reliable for use with the SOTAX® AT70 smart fully automated dissolution testing systems.

Depending on your filtration task you can choose filter membranes made from different materials:

Material	Page
Combi filters with glass fiber prefilters	
Polyester (GF/PET)	85

CHROMAFIL® BIGbox

- 400 color-coded quality syringe filters or 400 labeled Xtra syringe filters (25 mm)
- Food safe PE box with screw cap

CHROMAFIL® Xtra

Labeled for method validation and certification

- Xtra: imprint for direct identification of the membrane type, diameter and pore size
- Xtra: low bleeding PP housing
- Xtra: color-free plain polypropylene

CHROMAFIL® combi filters

Combi syringe filters with a coarse glass fiber prefilter and a small pore membrane as main filter

User benefits:

- For solutions with a high load of particulate matter: lower back pressure, easy filtration
- For high yields of filtrate: more mL of pure filtrate per filter

The technology

The glass fiber membrane (1.0 µm) removes coarse particles, before they can block the fine main membrane. This results in a better filtration efficiency, especially for highly contaminated samples.

- Housing: Solvent-resistant, ultra low bleeding polypropylene
- Inlet: Luer lock
- Exit: Luer
- Pore size: 1.0/0.20 µm or 1.0/0.45 µm
- Filter diameter: 25 mm
- Dead volume: < 80 µL
- Packing unit: 100 filters; BIGbox with 400 filters

Selection guide for syringe filters

How to select the optimal CHROMAFIL® syringe filter

1. Filter size

2. Pore size of filter membrane

3. Membrane type

Properties of sample	Recommended	Alternatives		
Aqueous, polar hydrophilic				
low particle-load	PET	H-PTFE	MV	RC
high particle-load	GF/PET	GF/RC	GF/PVDF	
prefiltration required				
Mid-polar e.g. HPLC eluents	PET	PA	RC	
Proteins				
low binding capacity of proteins	CA	PVDF	PES	
high binding capacity of proteins	GF	GF/PET	GF/PVDF	
Strong acids and bases	H-PTFE	PTFE

MACHEREY-NAGEL

FilterFinder · easy switching to first-class filters

It is that simple

1. Choose previously used manufacturer
2. Choose previously used part number
3. Start searching
4. Suitable CHROMAFIL® syringe filter will be suggested

Use our FilterFinder online at www.mn-net.com/filterfinder

Polyester with glass fiber prefilter (GF/PET)

★ Key features

- Hydrophilic multipurpose membrane
- For polar as well as nonpolar samples
- The HPLC filter with glass fiber prefilter, especially suited for mixtures of water and organic solvents
- Recommended for solutions with a high load of particulate matter or for highly viscous samples. Glass fiber exhibits a high protein-binding capacity.

Regenerated cellulose with glass fiber prefilter (GF/RC)

★ Key features

- Hydrophilic membrane
- For aqueous and organic-aqueous liquids, i.e. polar and medium polar sample solutions
- Recommended for solutions with a high load of particulate matter or for highly viscous aqueous solutions. Glass fiber exhibits a high protein-binding capacity.

Polyvinylidene difluoride with glass fiber prefilter (GF/PVDF)

★ Key features

- Hydrophilic membrane
- Recommended for the filtration of biological samples with high particle loads. Glass fiber exhibits a high protein-binding capacity.
- Also suited for the filtration of aqueous samples

Ordering information

Polyester (PET)

★ Key features

- Hydrophilic multipurpose membrane
- For polar as well as nonpolar solvents
- The HPLC filter, especially suited for mixtures of water and organic solvents
- For TOC/DOC determination
- Not cytotoxic, does not inhibit the growth of microorganisms and higher cells

Polytetrafluoroethylene (PTFE)

★ Key features

- Hydrophobic membrane
- For nonpolar liquids and gases
- Very resistant towards all kinds of solvents as well as acids and bases
- Flushing with alcohol, followed by water, makes the original hydrophobic membrane more hydrophilic

Cellulose acetate (CA)

★ Key features

- Hydrophilic membrane
- For the filtration of water-soluble oligomers and polymers, especially suited for biological macromolecules
- Very high shape stability in aqueous solutions
- Extremely low binding capacity for proteins (21 µg / 25 mm filter)
- Also available in a sterile package (S) for filtration under sterile conditions (each filter individually sealed)

Glass fiber (GF)

★ Key features

- Inert filter, nominal pore size 1 µm, allows higher flow rates than small pore filters
- For solutions with high loads of particulate matter or for highly viscous solutions (e.g., soil samples, fermentation broths). Glass fiber exhibits a high protein-binding capacity.
- As prefilters for other CHROMAFIL® filters, they prevent plugging of the membrane

Hints for using CHROMAFIL[®] syringe filters

For optimum filtration results we recommend to keep the following in mind:

- Either discard the first mL or rinse the filter unit with 1 mL of the solvent prior to filtration
- Before filling the syringe, draw about 1 mL air into the syringe in order to minimize the liquid remaining in the filter
- Start filtration with a slight pressure; this will optimize the throughput of the filter. As soon as particles accumulate on the filter, filtration will become more difficult and the pressure on the filter will increase.
- Change the filter whenever the resistance becomes too large in order to prevent rupture of the housing
- Do not apply CHROMAFIL[®] syringe filters on humans; they are only intended for lab use!
- Always use syringes ≥ 10 mL; smaller syringes can easily cause pressures above the 6 bar limit of the filters
- The temperature should not exceed 55 °C
- Do not re-use the filters

Disposable syringes with Luer tip

★ Key features

- Body and piston made from polypropylene (non sterile)

5 mL	100	729101
10 mL	100	729102

Chemical compatibility of filter materials

The chemical compatibility depends on several parameters such as time, pressure, temperature and concentration. In most cases, CHROMAFIL® filters will have only short contact with a solvent. In these cases they may be used despite of limited compatibility.

For example, a PTFE filter with PP housing does not liberate any UV-detectable substances during filtration of 5 mL THF, although PP shows only limited resistance towards THF.

The following table lists the chemical compatibility of our CHROMAFIL® materials.

Solvent	Material

CHROMAFIL® filtration cartridges

★ Key features

- Filtration cartridges for sample clarification under vacuum (e.g., using the CHROMABOND® vacuum manifold or SPE automation systems like Gilson ASPEC™, Rapidtrace®) or by gravity
- Cartridge sizes 3 mL and 6 mL
- Different membranes (PET, RC, PTFE, PVDF, GF) and pore sizes (0.2, 0.45 and 1.0 µm). Membrane materials correspond to the respective CHROMAFIL® syringe filters.

CHROMAFIL® MULTI 96 filter plates

★ Key features

- 96-well polypropylene plates for the simultaneous filtration of 96 samples
- Advantages of this high-throughput system are:
 - Economical by saving time and solvent
 - The use of multi-channel pipettors facilitates liquid transfer steps
 - Readily adaptable to all common automated and robotic handling systems
 - Minimized dead volume ($\leq 40 \mu\text{L}$)
- Membrane materials correspond to the respective CHROMAFIL® syringe filters

Technical data of vials

Except for the snap cap vials for storage of powdery samples and the blow-molded glass 70209.1, the vials of our program are made from 1st hydrolytic class glass. The dimensions stated in this catalog with respect to vial diameter and height are exact values. Please note that other suppliers often list rounded values (e.g., 12 x 32 mm instead of 11.6 x 32 mm), the actual dimensions are, however, identical due to the required fit in the instrument. Our data concerning the volume are defined realistically usable volumes, not calculated values. For reasons of safety we state rather low values. Here, too, deviations of data of other suppliers may occur, which either use the calculated volume (e.g., 2 mL instead of 1.5 mL) or a defined, realistically usable volume in the upper range (e.g., 1.8 mL instead of 1.5 mL). For suitability of certain vial types on instruments of the most important manufacturers please refer to the autosampler compatibility list at the end of this chapter.

Closure selection in GC/HPLC

The choice of the best closure depends on certain features of the instrument (needle type/design, transportation mechanism of the autosampler, etc.) as well as on the requirements of the application (temperature, sensitivity of the analysis, single/multiple injections, etc.) and thus is more complicated and more individual than selection of the correct vial type.

Basically the following recommendations can be made:

- Due to the relatively thick and blunt HPLC needles, only Silicone/PTFE closures, either with or without slit, should be used in combination with them
- Screw closures N 9 are universally suitable on most autosamplers, convenient in handling and available in a broad selection of different cap colors and septum materials. They fulfill all requirements with regard to tightness and analytical purity for GC as well as for HPLC. Due to the relatively thin septa penetration is safe and easy. Crimp closures N 11 are also universally suitable with regard to autosampler compatibility, however, they are not as safe and convenient in their closing technique as the screw closures N 9.
- Snap ring closures N 11 should only be used in HPLC, as the punctual compacting pressure of the septum against the vial rim by the four pins in the cap does not achieve the same level of tightness as the evenly applied pressure through a circular thread or by crimping.

- For sensitive analyses only high purity Silicone/PTFE closures can be used; if additionally there is a need for minimal coring during penetration, a PTFE/Silicone/PTFE septum (sandwich septum) is recommendable.
- Cap colors may be used for marking (sample marking/lab marking/shift marking). However, please consider that some autosamplers work with photocells which may not be able to recognize transparent caps.
- For sample storage closed top screw closures (without center hole) should be used. Generally, these also need an elastomeric liner for sealing vials with liquid samples tightly.

- Due to their artificially reduced cap height screw caps N 9 don't have a standardized thread design. Therefore, it is recommendable only to use vials and closures from one source of supply, in order to ensure a harmonious and tight matching of both components.
- Replacement septa are partially available, however, in case of manual assembly you have the risk of contamination with skin fat/sweat and of a possible wrong side orientation. Therefore we highly recommend only to use ready assembled closures, where the liner perfectly matches the cap and has been automatically inserted under strict hygienic conditions.
- Normally ready assembled closures should be suitable for all types of needles, provided the proper type of septum has been selected. Nevertheless, there might be cases where usage of bonded closures (cap and liner form an inseparable unit) can be recommendable. Example: blunt HPLC needle, however, due to the risk of sample loss/concentration changes no septa with slit can be used. In order to avoid that the unslit septum is pushed into the vial by the needle, you use a bonded closure with unslit septum.
- The following table shows the different physical and chemical properties of the various elastomeric septa materials:

Septa Guide

	Temperature resistance from/ to	Analytical purity	Fragmentation due to hardness and molecular structure (coring)	Hardness (needle penetration)	Resealability (in case of multiple injections)
PTFE virginal	-200 °C / 260 °C	very high		very hard (but very thin material)	no resealability
Natural rubber / PTFE	-40 °C / 120 °C	low	high, big particles	very hard	high
Red Rubber / TEF (FEP)	-40 °C / 110 °C	medium	medium	medium hard	medium
Butyl	-40 °C / 120 °C	medium	medium	medium hard	medium
Butyl / PTFE	-40 °C / 120 °C	medium	medium	medium hard	medium
Silicone / PTFE	-60 °C / 200 °C	high	low to medium	soft	low to medium
PTFE / Silicone / PTFE	-60 °C / 200 °C	high	very low	soft	very low

Certificates

Upon request we can issue (batch related) certificates of conformity for all vials, inserts and closures, if this is required for your own ISO documentation.

Samples

Sample packs of all vials and closures can be requested at any time. The sample packs contain 5 pieces of the respective product. These can be requested cost-free with the REF number of the respective product plus the addition ".MUSTER" (e.g., 1 x 70201HP.MUSTER = 1 sample pack with five vials of 70201HP).

Example for a sample pack with five vials

Example for a sample pack with five screw closures

Packaging

Vials: normally packed with 100 pieces in a PP box, bottom part being shrink-wrapped

Closures: normally packed with 100 pieces in a resealable PE zip lock bag

Vial Kits with 100 vials and closures each (for all vials 11.6 x 32 mm)

Translation tool for cross-references: the VialFinder at www.mn-net.com/vialfinder

The VialFinder is a database-driven translation tool for cross-references of instrument manufacturers and suppliers of consumables worldwide. The VialFinder immediately shows all options available from MACHEREY-NAGEL for the product of interest. The Finder shows 1:1 matches (in bold type) as well as possible alternative products (in normal type) that – in spite of technical differences to the indicated product – are suitable for the application. The corresponding link on the product description will lead you to the appropriate product page on our website that will give information on technical product features as well as possible illustrations of the product. In case you cannot find your part number via the VialFinder, please send your inquiry by e-mail to vials@mn-net.com providing us with all product information you may have. We will then check, if we can offer an equivalent product.

Miscellaneous

Should you need more information concerning this product range, you can ask for our separate brochure "Vials and caps" (KATEN200010), which – among others – features 1:1 drawings of all glass products.

Except where explicitly mentioned, septa are assembled ready to use. Septa beneath or beside a cap are shown for illustration purposes only, and they are pictured upside down.

All drawings in this chapter are scale 1:2.

General remarks

All information is subject to technical changes. All product data are subject to the currently valid specifications.

Contacts

Aside from your known contacts of our sales team you can also contact product management for technical questions at: vials@mn-net.com

Crimp neck vials and caps N 8

★ Key features

- 0.2–0.8 mL usable volume
- Adapter required for use in an autosampler
- Available with flat, round or conical bottom
- Economic closure versions: three-layer septum Natural rubber / Butyl / TEF or two-layer septum Red Rubber / FEP
- For more demanding analyses: high purity Silicone / PTFE septa

Screw neck vials and caps N 8

Screw neck vials and caps N 8

★ Key features

- Are among the oldest vial types for HPLC and GC (besides crimp neck vials N 11)
- More and more replaced by screw neck vials N 9, which are easier to fill due to the wide opening compared to screw neck vials N 8 with small opening
- Due to the cap design not universally usable on all autosamplers in GC and HPLC – however, often used on instruments of VWR (Merck®) / Hitachi, Varian®, Knauer, Gilson®, Shimadzu® and others
- In combination with closed top screw closures also used for sample storage (see page 120)
- Now also available as practical Vial Kits with 100 vials and closures each

Screw neck vials and caps N 9

Screw neck vials and caps N 9

★ Key features

- Can be used on almost all HPLC and GC autosamplers
- Large range of vials and closures
- Also available as bonded closures (advantage: thick (blunt) HPLC needles cannot push the septum into the vial)
- Also available as convenient Vial Kits with 100 vials and 100 caps and as presealed vial-closure combinations
- Now also 1.5 mL polypropylene vials N 9 for special applications (e.g., IC, CE, etc.)

Pre-sealed vials 702283: 1.5 mL screw neck vial N 9, 11.6 x 32 mm, clear, flat bottom, wide opening, label and scale	pre-screwed with 702288.1: N 9 PP screw cap, blue, center hole, Silicone white/PTFE blue, slit, 1.0 mm	100	702863
Pre-sealed vials 702284: 1.5 mL screw neck vial N 9, 11.6 x 32 mm, amber, flat bottom, wide opening, label and scale	pre-screwed with 702288.1: N 9 PP screw cap, blue, center hole, Silicone white/PTFE blue, slit, 1.0 mm	100	702873
Pre-sealed vials 702283: 1.5 mL screw neck vial N 9, 11.6 x 32 mm, clear, flat bottom, wide opening, label and scale	pre-screwed with 702026: N 9 PP bonded screw cap, blue, center hole, Silicone beige / PTFE white, 1.3 mm	100	702864

Other pre-sealed vial-closure combinations on request.

Screw neck vials and caps N 10

Screw neck vials and caps N 10

★ Key features

- Wide opening for easy filling
- Due to the cap height not universally suitable for all instruments
- Large range of bonded screw closures for a safe penetration (septa firmly connected with the cap; cannot be removed)
- Often used on Jasco, Shimadzu® and PerkinElmer® instruments
- On request also available as convenient Vial Kits with 100 vials and 100 caps

N 10 PP screw cap, black, center hole	no liner	-	100	702049

* Septum firmly connected with the cap, cannot be removed.

Crimp neck vials and caps N 11

★ Key features

- Broad variety of standard crimp neck vials (with small or wide opening), as well as crimp neck micro-vials for smaller sample volumes
- Economic closures: Natural rubber / TEF (2 layers), Natural rubber / Butyl / TEF (3 layers) and Red Rubber / FEP (2 layers)
- For more demanding analyses: analytically pure Silicone / PTFE septa with lower fragmentation
- Magnetic closure: REF 702879 for use on CTC GC PAL
- Manual and electronic crimping tools for vials N 11 can be found on pages 113 and 134–135

MACHEREY-NAGEL CHROMABOND® QuEChERS

The “Quick Easy Cheap Effective Rugged Safe” method

- High throughput, because of an easy handling and time-saving procedure
- Useful for sample preparation of many pesticides (“multi method”)
- Broad range of applications for different food
- Low solvent amounts
- High reproducibility and recovery rates
- No need for chlorinated solvents

Optimal crimping

For an optimal crimp result the crimping tool needs to be adjusted to:

- Type and height of the vial's crimp neck
- Thickness and hardness of the septa
- Properties of the cap (type, material)

For doing so, please refer to the instruction manual of the individual tool.

Permanent control of the crimp result and thus of the crimping tool settings is necessary.

Incorrect crimping can be recognized by the following features:

Cap deformation

Pulled up edge of the center hole

Strong formation of wrinkles

Convex looking liner

Cap can be turned with only low expenditure of power

Snap ring vials and caps N 11

Snap ring vials and caps N 11

★ Key features

- Quick, convenient sealing method which, however, should only be used in HPLC
- Can be used on all common HPLC autosamplers
- Alternatively crimp closures N 11 can be used (see preceding pages).
- 0.3 and 0.7 mL PP snap ring vials for special applications, e.g., for ion chromatography
- Most common closure: with cross-slit Silicone / PTFE septum, which supports easy penetration with the relatively thick, blunt HPLC needle
- Besides hard caps in transparent and blue also more easy to handle soft caps in light blue are available

Storage of samples in the fridge or in the freezer

Useful tips for sample handling

Generally sample vials should be stored in a vial container when being placed in the fridge or in the freezer, in order to avoid any condensations on the cap/septa surface that may go along with contaminations in the penetration area of the septa in the center hole. When filling the vial you have to consider the expansion rate of your sample to prevent breakage of the vial. Furthermore it is important to defreeze the sample at a later point in time very slowly (no sudden defreezing with hot water for example). With screw closures you may have to check, if restoring forces have been activated during the defreezing process and if you may have to tighten the screw closure. The choice of the correct closure (septum) depends on the storage temperature.

Special vials for special applications

Silanized glass vials / Plastic vials / Plastic vials with glass insert

- Silanized glass vials

Silanized glass vials have a deactivated inner glass surface, in order to reduce adsorption of polar substances. Therefore they are often used for the analysis of proteins, phenols and amino acids, which would – without any silanization of the glass surface – react with the OH-groups of the glass and thus would stick to the normally polar glass surface. It is also recommendable to use silanized vials respectively inserts for pH-sensitive and aqueous samples.

- Plastic vials

For some applications glass vials are not suitable due their composition and their chemical properties. Amongst these are heavy metal analysis, water and protein analysis, atomic absorption, capillary electrophoresis (CE) and ion chromatography (IC). For all these cases high purity polypropylene vials with 0.3 mL, 0.7 mL and 1.5 ml in transparent and amber are available.

- Plastic vials with glass insert

In comparison to the glass-in-glass products, glass-in-plastic systems are very robust, as the glass insert is well protected by the polypropylene outer shell. The tip of the micro-insert is centered by 100 per cent in an outlet at the bottom. The inserts sit firmly in the protective PP round bottom shell and thus can easily be filled. Another advantage of these systems is their excellent tightness, as the glass insert always constantly exceeds the rim of the plastic outer vial by 0.1 mm granting a firm sealing of the sample in the insert. Upon request also a silanized insert can be integrated into the plastic shell. The high transparent polypropylene enables a good view on the filling level.

Crimp neck vials and caps N 13

Crimp neck vials and caps N 13

★ Key features

- Usage of these vials and closures is more in the packaging area
- Height adjustable crimpers for aluminium crimp caps as well as for Flip Top / Flip Off crimp caps
- Butyl/PTFE septa with only central PTFE lamination, typically called Pharma-Fix septa, stand out due to their excellent sealing on the glass rims.

Container for crimp and screw neck vials N 13

Description	Pack of	REF
49 position container blue, with firmly integrated divider, for crimp and screw neck vials N 13, outer length 130 mm, outer width 130 mm, outer height 50 mm, with transparent lid (suitable for freezers)	1	702515

Vial rack for crimp and screw neck vials N 13

Description	Pack of	REF
50 position polypropylene vial rack blue, for all vials with a diameter of 15 mm max. and flat bottom Dimensions: 240 x 120 x 28 mm, stackable	1	702504

Container for crimp and screw neck vials N 13

Vial rack for crimp and screw neck vials N 13

Screw neck vials and caps N 13

★ Key features

- Generally used for large sample volumes in HPLC
- In combination with closed top screw closures suitable for sample storage (see pages 120–122)
- Compatible insert requires metal spring for central alignment
- Range of ready assembled closures and plain caps with center hole or with closed top as well as separate septa (PTFE virginal, Red Rubber / FEP and Silicone / PTFE) are available.

Screw neck vials and magnetic screw caps N 18

★ Key features

- Headspace vials for convenient, safe and consistent handling
- High tightness and better reproducibility of the sealing process (as compared to crimping)
- Thinner septum (1.5 mm instead of 3 mm septum thickness in crimp caps), thus safe penetration of the needle and less fragmentation (especially important for SPME applications)
- Improved run in autosamplers with magnets (CTC Combi PAL and equivalent instruments), since a flat surface for the magnet is ensured, thus avoiding that the filled vial can drop from the magnet

Crimp neck vials and caps N 20

Crimp neck vials and caps N 20

★ Key features

- Large range of Headspace crimp neck vials with different volumes and diameters
- Flat DIN crimp neck with stable bearing surface for the septum (especially suited for high vial pressures) as well as beveled HS crimp neck for instruments of certain manufacturers (PerkinElmer®).
- Assignment to respective instrument manufacturers in parentheses
- Different types of crimp closures depending on instrument and application
- Please consider our various crimping tools on pages 134-135.

N 20 PE cap, transparent, for flat DIN crimp neck N 20, 4.3 mm center hole (no liner)					100	70267			
as above, but with septum Butyl beige / PTFE gray, unassembled, 1.3 mm					100	70240			
as above, but with assembled septum natural rubber red-orange / TEF colorless, 1.3 mm					100	702129			

N 19 septa for PE caps N 20

Description	Illustration	Thickness	Pack of	REF
Butyl beige / PTFE gray		1.3 mm	100	70269
Natural rubber red-orange / TEF colorless		1.3 mm	100	702904
Silicone blue transparent / PTFE white		1.3 mm	100	702144

Screw neck vials and caps N 24 (EPA)

★ Key features

- Recommended for VOC and TOC analyses
- Closed top screw closures for sample storage
- Most frequently used: 40 mL clear glass
- Often called EPA vials, since they are defined in the regulations of the US Environmental Protection Agency
- Due to their size mainly used as bonded closure for a firm fit of the septum
- Recommended for environmental analysis: screw closure with center hole and Silicone / PTFE septum
- Universal screw closure 702168 with removable protection lid for sample storage and analysis

Pre-sealed vial-closure combinations with screw neck N 24

Vial description	Closure description	Pack of	REF
Pre-sealed vials 702021: 20 mL screw neck vial N 24, 27.5 x 57 mm, clear, flat bottom	pre-screwed with 702073: N 24 PP bonded screw cap, white, center hole, Red rubber / TEF colorless, 45° shore A, 2.5 mm	100	702865
Pre-sealed vials 702023: 40 mL screw neck vial N 24, 27.5 x 95 mm, clear, flat bottom	pre-screwed with 702058: N 24 PP bonded screw cap, white, center hole, Silicone white / PTFE beige, 45° shore A, 3.2 mm	100	702877

Other pre-sealed vial-closure combinations on request.

Universal screw closure N 24

All-in-one closure for sample storage and analysis, REF 702168

- Fits on all screw neck vials N 24 (EPA)
- Removable protection lid covers the penetration area and thus keeps the septa dust and contamination free
- Bonded Silicone / PTFE septa for safe penetration (septum is firmly connected to the screw cap)
- Ultrapure, soft Silicone / PTFE septa material prevents ghost peaks in the analysis
- Protection lid can repeatedly be removed and put on again

Containers

★ Key features

- Allow a secure transportation of sample vials
- Safe standing position in dividers designed for the respective diameter
- Ideal for space-saving storage in fridges, since the transparent lid prevents condensations on the closures and thus avoids a possible contamination in the cooling unit
- Available for all 1.5 mL vials (standard volume), for crimp and screw neck vials N 13 and for headspace vials with screw neck N 18 or crimp neck N 20, respectively as well as for EPA screw neck vials N 24

50 position polypropylene vial rack blue, for all vials with a diameter of 15 mm max. and flat bottom Dimensions: 240 x 120 x 28 mm, stackable	1	702504

Manual crimping tools

Advanced ergonomic version

Crimper available for 8 mm, 11 mm and 20 mm crimp caps

- More lightweighted than complete steel crimpers
- Ergonomically designed handles
- Adjustment by a knob on the crimping head that is easily accessible and visible
- Activated by bottom handle motion only which allows a steadier and safer hold of the tool during crimping
- Due to design and alignment of the crimping head better vertical clearance over the vial

Advanced ergonomic decappers allow safe removal of caps; no adjustment required (for 11 and 20 mm crimp caps available)

Standard version

Crimper available for 8, 11, 13 and 20 mm crimp caps

- Adjustable crimping height via hexagon key, which allows to move the inner part of the crimping head up and down (not possible for manual crimpers N 8)
- Crimping pressure adjustable via screw in the handle
- Manual crimpers for N 13 and N 20 Flip Top / Flip Off caps (pharmaceutical closures) available
- Long life time and convenient handling

Manual decappers (standard version) allow safe removal of caps; no adjustment required

Electronic crimping tools

Battery-powered electronic crimping tools

Available for 11 mm and 20 mm aluminium crimp caps (not suitable for 20 mm magnetic / bi-metal crimp caps). Mobile tools for consistent and reproducible crimping results

- Crimping pressure adjustable by pushing +/- buttons of the control unit on top of the tool
- Long lasting lithium ion cell batteries (full battery charge for several hundred vials, life time of battery > 1500 charges)
- CE certificate of conformity along with one year warranty
- One tool each necessary for crimping and for decapping
- For more convenient handling a stand is optionally available

Electronic high power crimping tool

Available for 11 mm and 20 mm crimp caps (also suitable for magnetic / bi-metal crimp caps). Due to a more powerful motor also suitable for magnetic and bi-metal crimp caps

- Fixed power supply
- Exchangeable crimping / decapping heads
- Digital LED display of crimp settings; different jaw settings can be stored in separate programs
- CE certificate of conformity along with one year warranty
- For more convenient handling a stand is optionally available

Autosampler compatibility charts

The autosampler compatibility charts generally show the most typical vials and closures for use on the instruments of a given manufacturer. In addition to the products listed in those charts, our catalog may contain other technically and functionally suitable products for use on a given autosampler which are not marketed actively as accessories by the respective manufacturer. We look forward to recommend any suitable product.

Compatibility charts have been compiled for the following instrument manufacturers: Agilent®, CTC, Dionex®, Knauer, PerkinElmer®, Shimadzu®, Thermo Scientific®, Varian® (Agilent®), VWR® (Merck®/Hitachi®), Waters®. Where applicable, each chart is divided into fields of use (GC, HPLC, Headspace).

We generally recommend that you ask for cost-free samples for testing purposes, as even technically comparable products may differ in their optical appearance.

We kindly ask for your understanding that we do not take over any guarantee for the correctness and completeness of the data indicated here.

High performance liquid chromatography (HPLC) is part of liquid chromatographic separating processes of substance mixtures and their analysis. At the beginning the technique was also called high pressure liquid chromatography due to the high back pressure of the column. HPLC offers qualitative (identification of substances) and quantitative (concentration determination) analysis by comparison with standard substances. The term HPLC was introduced in the 1970s, for the delineation of the high-performance method to the in the 1930s developed column liquid chromatography (column chromatography). At the beginning of the 21st century the HPLC was complemented by the even more efficient UHPLC (ultra high performance liquid chromatography). Hereby even higher pressures (> 400 bar) result in shorter analysis time and enhanced efficiency enabling a higher sample throughput with smaller sample volumes.

Application

HPLC / UHPLC is used additionally to gas chromatography (GC) for separation and determination of complex substance mixtures composed of low-volatile, polar and ionic, high-molecular or thermal instable substances. Therefore a sufficient solubility of the sample in a solvent or a solvent mixture is required. HPLC / UHPLC is used for purity control of chemicals and industrial products, determination of active agents for drug development, production and testing, environmental analytics, quality and purity control of foods, analysis of ingredients in cosmetics as well as for the isolation of biopolymers.

Basic principle

In liquid column chromatography a mobile phase (eluent) flows through a particle filled tube (separation column, stationary phase). In classic column chromatography this tube is a glass column with an inner diameter of several centimeters and a length up to 450 mm or even bigger. The filling material typically consists of coarse-grained particles like silica gel 60. The eluent is transported through the separation column either by hydrostatic pressure or a low-pressure pump with 1.5-2 bar.

In contrast HPLC columns consist of stainless steel with an inner diameter of 2-4.6 mm and a length of 20-300 mm. The column packing, mostly modified porous silica, has generally a particle size of 3, 5, 7 or 10 μm and a pore size of 50, 100, 120 (for low-molecular analytes) or 300-4000 \AA (for high-molecular analytes). In UHPLC shorter columns in the range of 20-150 mm length with highly efficient particles of 1.8 μm size (sub-2 μm) are utilized. A guard column of a few millimeters length can be utilized and installed with a specific Column Protection System to increase the column lifetime. HPLC / UHPLC uses a high-pressure pump to transport the eluent from a storage vessel into the system with a column back pressure of up to 600 / 1200 bar.

Instrument

HPLC as well as UHPLC instruments have different building blocks. The storage vessel (eluent reservoir, 1) usually contains a deaerator unit (3) for the solvents. Followed by a gradient valve (4) with mixing chamber (5) in flow direction, which allows the usage of isocratic as well as gradient methods. A high-pressure pump (6) transports the sample into the system. The sample is injected via an injection valve (7). Usually this is operated automatically with a syringe by an autosampler. With the eluent flow the sample is transported to the guard and the separating column (8). For better reproducibility of the separation tempering with a column oven (2) should be performed. The separated substances are determined with a detector (9). In the resulting chromatogram each detector signal of a substance (peak), is related to the retention time of the column. With the data evaluation (10) these peaks can be identified and their concentration can be determined.

Separation mechanism

While flowing through the column each component of the solved mixture interacts differently with the stationary phase. According to the characteristics of the substance (hydrophobic, polar, ionic, aromatic, sterically hindered etc.) the strength of the interactions vary and thus the compounds are retained by the stationary phase in different ways. Essentially a distinction is drawn between normal phase (NP), reversed phase (RP) and ion exchange chromatography. Depending on the structure of the stationary phase diverse interactions e.g., van der Waals forces or π - π -stacking can occur and different polar mobile phases are required. For polar stationary normal phases (e.g., SiOH, CN, OH, NH₂) non-polar eluents like *n*-heptane, hexane, dichloromethane or 2-propanol are applicable. While for reversed phases (e.g., C₁₈, C₈, C₄, C₂, C₆H₅) typically polar RP eluents (e.g., acetonitrile or methanol with ultrapure water or buffer) and for ion exchange (e.g., SA, SB) aqueous buffers (e.g., phosphate, acetate, citric buffer) come to use.

Selectivity

The characteristic separation behavior of phases under certain conditions is also called selectivity. This is dependent on different parameters like structure and modifications of the base silica gel, nature of the chemical binding or the type of endcapping. In recent decades several methods have been developed to compare and distinguish the selectivity of various silica gels and their modifications. In this connection defined substances or substance classes are analyzed and the chromatographic parameters are graphically presented. A frequently applied model in specialist literature is e.g., the TANAKA plot, which allows a quick comparison of different HPLC phases. [4]

Parameter of the Tanaka diagram:

Capacity = k' (pentylbenzene)

Hydrophobicity = α (pentylbenzene, butylbenzene)

Steric selectivity = α (triphenyl, *o*-terphenyl)

Hydrogen bonding capacity (capacity of silanol) = α (caffeine, phenol)

Ion exchange capacity at pH 2.7 = α (benzylamine, phenol)

Ion exchange capacity at pH 7.6 = α (benzylamine, phenol)

The comparison of NUCLEOSHELL® RP 18 and NUCLEOSHELL RP® 18plus for example shows a lower ion exchange capacity at pH 7.6 for the monomeric NUCLEOSHELL® RP 18plus. The radar chart also reflects a more pronounced steric selectivity of NUCLEOSHELL® RP 18 due to a higher density of modifications with C₁₈ chains.

Characteristic parameters

The success of a chromatographic separation depends apart from the stationary and mobile phase also on other characteristics like the quality of the separating column or the linear flow rate. The following schematic chromatogram illustrates the most important parameters which characterize a separation.

Schematic chromatogram

Peak width:	
$w_{1/2}$	peak width at half height
w	peak width of the peak (intersection point of the inflectional tangents with the zero line)
Peak symmetry:	
A	peak front to peak maximum at 10% of peak height
B	peak maximum to peak end at 10% of peak height
Retention time::	
t_0	dead time of a column = retention time of a non-retarded substance
t_{R1}, t_{R2}	retention times of components 1 and 2
t'_{R1}, t'_{R2}	net retention times of components 1 and 2

In a chromatographic system the substances differ from each other in their retention time in or on the stationary phase. The time, which is needed by a sample component to migrate from column inlet (sample injection) to the column end (detector) is the retention time t_{R1} or t_{R2} . The dead time t_0 is the time required by an inert compound to migrate from column inlet to column end without any retardation by the stationary phase. Consequently, the dead time is identical with the retention time of the sample component remaining in the stationary phase. The difference of total retention time and dead time yields the net retention time t'_{R1} or t'_{R2} , which is the time a sample component remains in the stationary phase.

$$t'_{R1} = t_{R1} - t_0 \text{ bzw. } t'_{R2} = t_{R2} - t_0$$

To compare chromatograms that are recorded with columns of different lengths and internal diameters, as well as different flow rates, the retention time is converted into a dimensionless capacity factor k' .

$$k'_1 = \frac{t_{R1} - t_0}{t_0} \text{ bzw. } k'_2 = \frac{t_{R2} - t_0}{t_0}$$

The relative retention α , also known as the separation factor, describes the ability of a chromatographic system (stationary and mobile phase) to distinguish between two compounds. This

is calculated from the rate of the capacity factors of the substances, where the figure in the denominator is the reference compound.

$$\alpha = \frac{k'_2}{k'_1}$$

The resolution R is a measure for the efficiency of the column to separate two substances. Besides the retention time t_R the peak width at half height $w_{1/2}$ is also included.

$$R = 1.18 \cdot \frac{t_{R2} - t_{R1}}{(w_{1/2})_2 + (w_{1/2})_1}$$

For practical reasons the peak symmetry is calculated at 10% of peak height. Ideally symmetry should be 1, i.e. $A = B$. Values > 1 indicate peak tailing, while values < 1 indicate peak fronting.

$$\text{Peak symmetry} = \frac{B}{A}$$

Instead of the mobile phase volumetric flow rate [mL/min], which is controlled at the HPLC instrument, it is advantageous to use the linear velocity u [cm/sec]. The linear velocity is independent of the column cross section and proportional to the pressure drop in the column. The linear velocity can be calculated by means of the dead time, where L is the column length in cm and t_0 the dead time in sec.

$$u = \frac{L}{t_0}$$

The quality of a column packing is determined through the number of theoretical plates N . High N values indicate a high capability to separate complex sample mixtures.

$$N = 5.54 \cdot \left(\frac{t_{R1}}{w_{1/2}} \right)^2$$

The value of the height equivalent to a theoretical plate HEPT is a criterion for the quality of a column. HEPT, is the length, in which the chromatographic equilibrium between mobile and stationary phase has been adjusted once. Its value depends on the particle size, the flow velocity, the mobile phase viscosity and especially on the packing quality. Small HEPT values, meaning a large number of theoretical plates N , facilitate the column to separate complex sample mixtures.

$$H = \frac{L}{N}$$

The Van Deemter equation shows the dependence of the HEPT on the velocity u .

$$H = A + \frac{B}{u} + C \cdot u$$

A term = eddy-diffusion, B term = longitudinal diffusion coefficient, C term = mass transfer coefficient, H = HEPT = height equivalent to a theoretical plate

The A term, also called eddy-diffusion, is a function of the particle size, the B term a function of the diffusion coefficient of the substance in the mobile phase and the C term the retardation

of a substance by the interface between stationary and mobile phase. In the point of intersection of h_{\min} and u_{opt} the optimal separation efficiency for a column with high peak symmetry for the separated substances is obtained.

Column quality

Each HPLC/UHPLC column of MACHEREY-NAGEL is individually tested according to the most important characteristic parameters in quality control and the results are documented in a certificate of analysis.

Detailed information of the particular properties of the high-purity silica phases NUCLEODUR®, of the established standard silica NUCLEOSIL® and the modern Core-Shell material NUCLEOSHELL® as well as phases for special separations and the equivalent HPLC- and UHPLC-columns can be found on the following pages.

Strict quality specifications for outstanding reliability

- Highest production standard
our facilities are EN ISO 9001:2008 certified
- Perfect reproducibility from batch to batch and within each lot
- Each column is individually tested and supplied with test chromatogram and test conditions.

Test mixture* for reversed phase columns
in acetonitrile, pack of 1 mL
REF 722394

Furthermore custom-packed columns with different column types, dimensions and particle sizes are available on request.

* This product (REF 722394) contains harmful substances which must be specially labeled as hazardous. For detailed information please see SDS.

NUCLEODUR[®] is a fully synthetic type B silica (silica of 3rd generation) offering highly advanced physical properties like totally spherical particle shape, outstanding surface micro-structure, high pressure stability and low metal content.

NUCLEODUR[®] as a state-of-the-art silica is the ideal base material for modern HPLC phases. It is the result of MACHEREY-NAGEL's pioneering research in chromatography for more than 40 years.

In RP liquid chromatography the efficiency of the packing is strongly affected by the quality of the base silica itself. Shortcomings in the surface geometry of the particles or metal contaminants are the main reasons for inadequate coverage with the covalently bonded alkylsilanes in the subsequent derivatization steps. It is well known, that poor surface coverage and, in consequence, high activity of residual free silanols often results in peak tailing or adsorption, particularly with basic compounds.

Particle shape and surface symmetry

NUCLEODUR[®] silicas are synthesized in a unique and carefully controlled manufacturing process which provides silica particles, which are totally spherical. The picture shows the outstanding smoothness of the NUCLEODUR[®] surface.

Purity

As already mentioned above, a highly pure silica is required for achieving symmetric peak shapes and maximum resolution. Inclusions of, e.g., iron or alkaline earth metal ions on the silica surface are largely responsible for the unwanted interactions with ionizable analytes, e.g., amines or phenolic compounds.

NUCLEODUR[®] is virtually free of metal impurities and low acidic surface silanols. Elemental analysis data of NUCLEODUR[®] 5 μm measured by AAS are listed below.

Elementary analysis (metal ions) of NUCLEODUR[®] 100-5

Aluminum	< 5	ppm
Iron	< 5	ppm
Sodium	< 5	ppm
Calcium	< 10	ppm
Titanium	< 1	ppm
Zirconium	< 1	ppm
Arsenic	< 0.5	ppm
Mercury	< 0.05	ppm

Pressure stability

The totally spherical and 100 % synthetic silica gel exhibits an outstanding mechanical stability, even at high pressures and elevated eluent flow rates. In addition, after several cycles of repeated packing, no significant drop in pressure can be observed. The latter is of prime importance for preparative and process-scale applications.

NUCLEODUR[®] silica is available with two pore sizes – 110 Å pore size as standard material and as 300 Å widepore material for the separation of biomolecules, like peptides and proteins.

Physical data of NUCLEODUR[®]

	Standard	Widepore
Pore size	110	300 Å
Surface area (BET)	340 m ² /g	100 m ² /g
Pore volume	0.9 mL/g	0.9 mL/g
Density	0.47 g/mL	0.47 g/mL

NUCLEODUR[®] modifications

Several different surface modifications based on NUCLEODUR[®] silica have been developed over the last years providing a full range of specified HPLC phases and an ideal tool for every separation.

For a summary of important properties of our NUCLEODUR[®] phases please see page 152.

1.8 µm particles for increased separation efficiency

Key feature

- Decrease of analysis time (ultra fast HPLC)
- Shorter columns with high separation efficiency and significant improvement of resolution and detection sensitivity
- Suitable for LC/MS due to low bleeding characteristics

Fractionation

- NUCLEODUR® 1.8 µm particles are fractionated to limit the increase in back pressure.

Availability

- The following NUCLEODUR® phases are available in 1.8 µm:
C₁₈ Gravity, C₈ Gravity, C₁₈ Gravity-SB, C₁₈ Isis, C₁₈ Pyramid, PolarTec, Phenyl-Hexyl, PFP, Sphinx RP, C₁₈ HTec and HILIC

Advantages of 1.8 µm particle size

Miniaturization started in the early stage of HPLC with the reduction of particle size from 10 µm via 7 µm to standard 5 µm – still the most used particle diameter in analytical HPLC – to 3 µm spherical particles. With the introduction of 1.8 µm NUCLEODUR® particles researchers have turned over a new leaf in HPLC column technology, featuring extraordinary improvements in terms of plate numbers, column efficiency and resolution compared with 3 µm particles.

Increased separation efficiency by higher number of theoretical plates (N):

- 50 x 4.6 mm NUCLEODUR® C₁₈ Gravity
- 3 µm: N ≥ 100 000 plates/m (h-value ≤ 10)
- 1.8 µm: N ≥ 166 667 plates/m (h-value ≤ 6)

Increase of the plate number by ~ 67 % offers the possibility of using shorter columns with equal plate number resulting in a decrease of analysis time.

Significant improvement in resolution

$$R_s = \frac{\sqrt{N}}{4} \left(\frac{\alpha - 1}{\alpha} \right) \left(\frac{k'_i}{k'_i + 1} \right)$$

R_s = resolution, α = selectivity (separation factor), k'_i = retention
N = plate number with N ∝ 1/d_p, d_p = particle diameter

Use of 1.8 µm instead of 3 µm particles leads to an increase of resolution by a factor of 1.29 (29 %) since the resolution is inversely proportional to the square root of the particle size.

Column back pressure

Due to the smaller particles the back pressure will increase according to

$$\Delta_p = \frac{\Phi \cdot L_C \cdot \eta \cdot u}{d_p^2}$$

Δ_p = pressure drop, Φ = flow resistance (nondimensional), L_C = column length, η = viscosity, u = linear velocity, d_p = particle diameter

The high sphericity of the NUCLEODUR® particles and the very narrow particle size distribution allow to keep the back pressure on a moderate level.

Comparison of back pressures

Eluent 100 % methanol, flow rate 1.5 mL/min
temperature 22 °C, column dimensions 50 x 4.6 mm

	NUCLEODUR® C ₁₈ Gravity	Competitor
3 µm	70 bar	–
1.8 µm	130 bar	170 bar

Higher flow rates and shorter run times

The optimal flow rate for 1.8 µm particles is higher than for 3 and 5 µm particles (see figure – the flow rate should be at the van Deemter minimum).

Van Deemter curves

Technical requirements

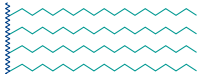

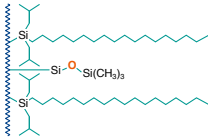

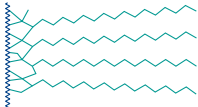

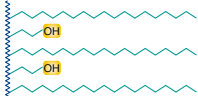

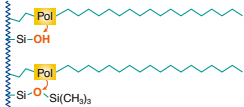

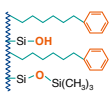

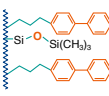

To gain best results with 1.8 µm particles certain technical demands must be met including pumps for flow rates of 2–3 mL with pressures of 250–1000 bar, minimized dead volume, and fast data recording.

★ Key feature

- Suitable for LC/MS and HPLC at pH extremes (pH 1–11)
- Superior base deactivation
- Ideal for method development

🔧 Technical data

- Available as octadecyl (C₁₈) and octyl (C₈), multi-encapped
- Pore size 110 Å; particle sizes 1.8 µm, 3 µm and 5 µm for C₁₈, 1.8 and 5 µm for C₈; 7, 10, 12 and 16 µm particles for preparative purposes on request
- Carbon content 18 % for C₁₈, 11 % for C₈

✓ Recommended application

- Overall sophisticated analytical separations
- Compound classes separated include pharmaceuticals, e.g., analgesics, anti-inflammatory drugs, antidepressants; herbicides; phytopharmaceuticals; immunosuppressants

Base deactivation

NUCLEODUR[®] C₁₈ Gravity and NUCLEODUR[®] C₈ Gravity are based on the ultrapure NUCLEODUR[®] silica. Derivatization generates a homogeneous surface with a high density of bonded silanes (~18 % C for C₁₈, ~11 % C for C₈). Thorough endcapping suppresses any unwanted polar interactions between the silica surface and the sample, which makes “Gravity” particularly suitable for the separation of basic and other ionizable analytes. Even strongly basic pharmaceuticals like amitriptyline are eluted without tailing under isocratic conditions. For a discussion of the different retention behavior of C₁₈ phases compared to C₈ phases see page 182.

Enhanced pH stability

One major disadvantage of silica stationary phases is limited stability at strongly acidic or basic pH. Cleavage of the siloxane bonding by hydrolysis, or dissolution of the silica will rapidly lead to a considerable loss in column performance. Conventional RP phases are usually not recommended to be run with mobile phases at pH > 8 or pH < 2 for extended periods of time. The special surface bonding technology and the low concentration of trace elements of NUCLEODUR[®] C₁₈ and C₈ Gravity allow for use at an expanded pH range from pH 1 to 11.

Benefits of enhanced pH stability

An expanded pH range is often required in method development. Many nitrogen containing compounds like basic drugs are protonated at acidic or neutral pH and exhibit poor retention on a standard C₁₈ phase. The retention behavior can be improved by working at a higher pH, where the analyte is no longer protonated, but formally neutrally charged, as a rule between pH 9–10. For acidic analytes it is exactly in inverse proportion, maximum retention can be attained at low pH.

Surface silanols at different pH values

The figure above shows the extent of protonation of surface silanols and of two exemplary analytes at acidic and alkaline pH. The following graph explains the general correlation between retention and pH.

Correlation between retention and pH for basic and acidic compounds

An example how selectivity can be controlled by pH is the separation of the acid ketoprofen, the base lidocaine and benzamide. Under acidic conditions the protonated lidocaine is eluted very fast due to lack of sufficiently strong hydrophobic interactions between analyte and C₁₈ chains, while the formally neutral keto- profen is eluted after about 3 min. However, at pH 10 a reversal of the elution order, with a visibly longer retention time for the basic lidocaine, is observed.

As mentioned above, pH stability of the stationary phase can be helpful for improving selectivity in method development. The following figure shows the separation of 4 basic drugs under acidic and basic conditions.

At pH 2.5 the protonated analytes exhibit poor retention (early elution) and in addition an inadequate resolution for papaverine and noscapine, whilst the formally non ionized molecules can be baseline separated due to the better retention pattern at alkaline pH.

The following chromatogram demonstrates the stability of NUCLEODUR® C₁₈ Gravity under alkaline conditions. The ultra-pure Gravity with its unique high density surface bonding technology withstands strong alkaline mobile phase conditions.

Stability of NUCLEODUR® C₁₈ Gravity at pH 11

MN Appl. No. 120850

Column: 50 x 4.6 mm NUCLEODUR® C₁₈ Gravity, 5 µm
 Eluent: methanol – water – ammonia (20:80:0.5, v/v/v), pH 11
 Flow rate: 1.3 mL/min
 Temperature: 30 °C
 Detection: UV, 254 nm
 Injection: 2.0 µL

Peaks:
 1. Theophylline
 2. Caffeine

Even after 300 injections no loss of column efficiency – identified, e.g., by peak broadening or decrease in retention times – could be observed.

Under alkaline conditions dissolution of the silica support is possible, resulting in dead volume and thus peak broadening. It is worth mentioning, that this phenomenon also depends on type and concentration of buffers, as well as on the temperature. It is well known that the use of phosphate buffers, particularly at

elevated temperatures, can reduce column lifetime even at moderate pH. If possible, phosphate buffers should be replaced by less harmful alternatives.

The following chromatograms show the excellent column stability of NUCLEODUR® C₁₈ Gravity in acidic conditions. Retention times of all three compounds in the column performance test remain consistent and virtually unchanged, even after the column is run with 5000 mL eluent. Due to the extremely stable surface modification, no cleavage of the Si-O-Si bonding occurs, column deterioration is therefore successfully prevented.

Stability of NUCLEODUR® C₁₈ Gravity at pH 1.5

MN Appl. No. 120840

Column: 125 x 4 mm NUCLEODUR® C₁₈ Gravity, 5 µm
 Eluent: acetonitrile – 1 % TFA in water (50:50, v/v), pH 1.5
 Flow rate: 1.0 mL/min
 Temperature: 30 °C
 Detection: UV, 230 nm
 Injection: 5 µL

Peaks: 1. Pyridine, 2. Toluene, 3. Ethylbenzene

NUCLEODUR[®] C₁₈ Gravity-SB hydrophobic phase with polar selectivity · USP L1

★ Key feature

- Hydrophobic C₁₈ phase with distinct polar selectivity, ideal for method development, better retention of early eluting substances
- Excellent performance under highly aqueous conditions
- Suitable for LC/MS due to low bleeding characteristics

🔧 Technical data

- Monomeric octadecyl modification, extensive endcapping
- Pore size 110 Å; available particle sizes 1.8 µm, 3 µm and 5 µm; carbon content 13 %; pH stability 1–9

✓ Recommended application

- Overall sophisticated analytical separations, especially for polar compounds, e.g., antibiotics, water-soluble vitamins, organic acids

NUCLEODUR[®] C₁₈ Gravity-SB excels with a relatively high hydrophobicity – similar to C₁₈ Gravity – while simultaneously showing distinctive polar selectivity, without having polar embedded groups or polar endcapping. As a result the column displays better retention of early eluting analytes and high performance under strongly aqueous conditions. Additionally the column is suitable for LC/MS due to low bleeding characteristics. These features are achieved through side chains (isobutyl) of the monomeric C₁₈ phase.

In the TANAKA plot the NUCLEODUR[®] Gravity-SB shows similar hydrophobicity than the Gravity, however with a reduced capacity. The ion exchange capacity under basic conditions (pH 7.6) is high, which favors good retention of early eluting, polar substances.

Due to the broad selectivity and stability the base deactivated NUCLEODUR[®] C₁₈ Gravity-SB is versatile applicable, especially for polar analytes like nucleobases or pesticides the column shows good separation efficiency.

Pesticide mix (Ehrenstorfer, 17 components)

NUCLEODUR[®] C₁₈ Isis phase with high steric selectivity · USP L1

★ Key feature

- Exceptional steric selectivity
- Outstanding surface deactivation
- Suitable for LC/MS and HPLC at pH 1–10

🔧 Technical data

- C₁₈ phase with special polymeric, crosslinked surface modification; pore size 110 Å; particle sizes 1.8 μm, 3 μm and 5 μm; carbon content 20 %

✓ Recommended application

- Steroids, (*o,p,m*)-substituted aromatics, fat-soluble vitamins

Surface modification

By use of specific C₁₈ silanes and polymeric bonding technologies a dense shield of alkyl chains protects the subjacent silica matrix. Elemental analysis of NUCLEODUR[®] C₁₈ Isis shows a carbon load of 20 %. The target crosslinking of the C₁₈ chains on the surface enables the separation of compounds with similar molecular structure but different stereochemical properties. The technical term for this feature is steric selectivity.

Slot Model

Sander and Wise [5] proposed a model for the retention of aromatic compounds based on molecular shape, which is referred to as “Slot Model”. This model pictures the bonded C₁₈ phase on the silica surface with slots which the analytes have to penetrate during retention. Planar molecules are able to penetrate these slots deeper than non-planar molecules of similar molecular weight and length-to-width ratio. Thus triphenylene (lower structure) is longer retained than *o*-terphenyl (upper structure).

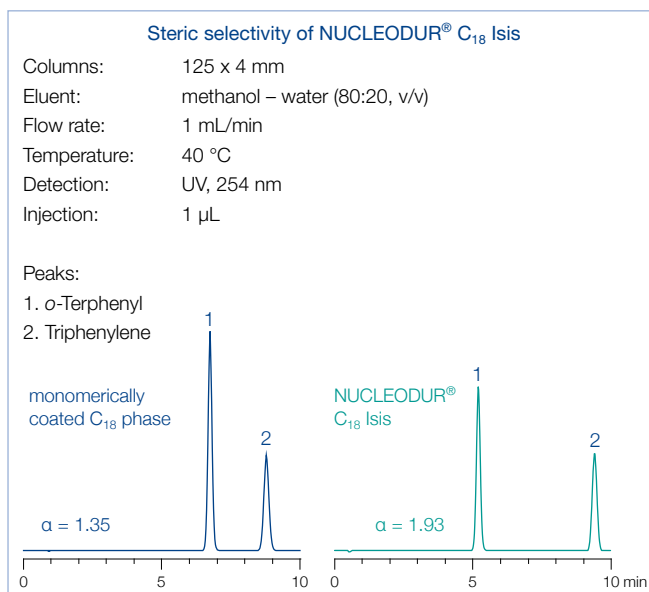

Steric selectivity

The following chromatograms reveal the improved resolution for positional isomers in a test mixture of aromatic compounds on NUCLEODUR[®] C₁₈ Isis (green) in direct comparison with monomerically coated (blue) and polar endcapped (orange) C₁₈ columns.

The separation of *o*-terphenyl and triphenylene is a good example to evaluate the selectivity of a RP column in terms of the shape of two molecules. The phenyl rings of *o*-terphenyl are twisted out of plane while triphenylene has a planar geometry. The separation factor α is a measure for the steric selectivity. As is shown below the α value is considerable larger on NUCLEODUR[®] C₁₈ Isis compared to a conventional C₁₈ column.

The surface bonding technology also provides improved stability features for the NUCLEODUR[®] C₁₈ Isis phase.

Surface deactivation

The chromatography of basic analytes requires a high density of surface-bonded C₁₈ silanes combined with a thorough endcapping procedure to keep silanol activity at a minimum. This ensures tailing-free elution of even strongly basic amino-containing compounds (see application 121210 at www.mn-net.com/apps).

NUCLEODUR[®] C₁₈ Pyramid phase for highly aqueous eluents · USP L1

★ Key feature

- Stable in 100 % aqueous mobile phase systems
- Interesting polar selectivity features
- Excellent base deactivation; suitable for LC/MS due to low bleeding characteristics

🔧 Technical data

- Special phase with polar endcapping; pore size 110 Å; particle sizes 1.8 µm, 3 µm and 5 µm (7 and 10 µm particles for preparative purposes on request); carbon content 14 %; pH stability 1–9

✓ Recommended application

- Analgesics, penicillin antibiotics, nucleic acid bases, water-soluble vitamins, complexing agents, organic acids

RP-HPLC with highly aqueous mobile phases

The efforts to neutralize unwanted silanol activity often results in well base-deactivated RP phases with high carbon load, but a limited scope of selectivity beyond non-polar interactions. Polar compounds like carboxylic acids or drug metabolites show only weak retention on densely bonded RP columns due to distinct hydrophobic properties but low polar interactions. Very polar analytes require highly aqueous mobile phases for solubility and retention. Conventional reversed phase columns often display stability problems in eluent systems with high percentage of water (> 95 %) as evidenced by a sudden decrease of retention time and overall poor reproducibility. This phenomenon is described as phase collapse caused by the mobile phase expelled from the pores due to the fact, that hydrophobic RP phases are incompletely wetted with the mobile phase [6].

Different approaches can be used to increase column stability with highly aqueous mobile phase systems. The most promising concepts are incorporating a polar group in the hydrophobic alkyl chain, or using hydrophilic endcapping procedures to improve the wettability of the reversed phase modification. NUCLEODUR[®] PolarTec may be taken as an example for the embedded polar group strategy, in which a C₁₈ silane with a polar function is successfully linked to the silica surface.

Stability features

NUCLEODUR[®] C₁₈ Pyramid is a silica phase with hydrophilic endcapping, designed especially for use in eluent systems of up to 100 % water. The upper figure shows the retention behavior of tartaric, acetic and maleic acid under purely aqueous conditions on NUCLEODUR[®] C₁₈ Pyramid in comparison with a conventionally bonded C₁₈ phase.

It can be shown that the retention times for NUCLEODUR[®] C₁₈ Pyramid remain nearly unchanged between initial injection and restart after the flow has been stopped for 12 h, whilst the performance of the conventional RP column already collapsed totally after 5 min.

Retention characteristics

The polar surface exhibits retention characteristics different from conventional C₁₈ phases. Application 119170 shows the improved retention behavior of the very polar short chain organic acids, which are insufficiently retained on RP columns with predominantly hydrophobic surface properties. In addition to the exceptional polar selectivity NUCLEODUR[®] C₁₈ Pyramid also provides adequate hydrophobic retention (see applicati-

on No. 19190 at www.mn-net.com). The perceptible increase in polarity has no impact on the retention behavior of ionizable analytes. Even with the strongly basic compounds of the tricyclic antidepressant drug test mixture, no unwanted interactions or a so-called lack in base deactivation are observed (see application 119200 at www.mn-net.com/apps).

NUCLEODUR[®] PolarTec RP phase with embedded polar group · USP L1 and L60

★ Key feature

- Excellent base deactivation
- Suitable for LC/MS and 100 % aqueous eluents
- Pronounced steric selectivity

🔧 Technical data

- Phase with embedded polar group; pore size 110 Å; particle sizes 1.8 μm, 3 μm and 5 μm; carbon content 17 %; pH stability 1–9

✓ Recommended application

- Exceptional selectivity for phenols and nitrogen containing compounds, polar compounds like basic pharmaceuticals, organic acids, pesticides, amino acids, water-soluble vitamins, etc.

RP-HPLC under 100 % aqueous conditions

The dominant form of interactions of conventional C₁₈ phases are nonpolar London dispersion forces. Besides nonpolar interactions phases with embedded polar groups possess the ability to show polar interactions (dipole-dipole, hydrogen bonds, π-π, etc.). These interactions enhance retention and selectivity for polar compounds like carboxylic acids, phenols and nitrogen containing compounds.

Due to the shielding effect of the embedded group NUCLEODUR[®] PolarTec shows an excellent base deactivation, which is at the top-notch of embedded polar group phases on the market. The pronounced steric selectivity (see Tanaka plot) is an additional tool for the separation of complex mixtures.

Due to low bleeding characteristics NUCLEODUR[®] PolarTec is also suitable for LC/MS.

Even after days or weeks of operation in purely aqueous eluents the C₁₈ chains of NUCLEODUR[®] PolarTec are neither folded nor show any collapsing. A significant reduction of retention time cannot be observed.

Separation of histidines

MN Appl. No. 125140

Column: 150 x 3 mm NUCLEODUR[®] PolarTec, 3 μm
Eluent: 1.0 mmol/L perfluoropentanoic acid in water –
0.5 mmol/L perfluoropentanoic acid in acetonitrile
(99.5:0.5, v/v)
Flow rate: 0.4 mL/min
Temperature: 20 °C
Detection: UV, 230 nm

Peaks:

1. 3-Methylhistidine R₁ = H, R₂ = CH₃
2. Histidine R₁ = R₂ = H
3. 1-Methylhistidine R₁ = CH₃, R₂ = H

In order to increase retention for polar compounds it is often necessary to decrease the organic ratio of the mobile phase to zero. Under these conditions many conventional C₁₈ phases display the so-called dewetting effect which means that the mobile phase is expelled from the pores. This phenomenon leads to a dramatic loss in retention. NUCLEODUR[®] PolarTec is stable in 100 % aqueous mobile phases and therefore especially suited for the separation of polar compounds like organic acids.

Stability of NUCLEODUR[®] PolarTec

MN Appl. No. 124610

Column: 150 x 3 mm NUCLEODUR[®] PolarTec, 3 μm
Eluent: 30 mmol/L KH₂PO₄, pH 3.0
Flow rate: 0.5 mL/min
Temperature: 30 °C
Detection: UV, 220 nm

Peaks:

1. Cytosine
2. Uracil
3. Adenine
4. Guanine
5. Thymine

Measurement every 14 h;
in between flow was stopped

In spite of the polar character of the embedded functional group NUCLEODUR[®] PolarTec exhibits sufficient hydrophobic properties and is very well suited for analyzing basic compounds.

NUCLEODUR[®] Phenyl-Hexyl productive for polar/aromatic compounds · USP L11

★ Key feature

- Hydrophobic phase with alternative selectivity compared to classical C₁₈ modifications
- Separation principle based on 2 retention mechanisms: π-π interactions and hydrophobic interactions
- Suitable for LC/MS due to low bleeding characteristics

🔧 Technical data

- Phase with phenyl-hexyl modification and multi-encapping; pore size 110 Å; particle sizes 1.8 μm, 3 μm and 5 μm; carbon content 10 %; pH stability 1–10

✓ Recommended application

- Aromatic and unsaturated compounds, polar compounds like pharmaceuticals, antibiotics

Phenylhexyl modified phases are an interesting alternative to classical C₁₈ phases due to an excellent separation of aromatic and unsaturated compounds especially with electron withdrawing groups.

The combination of hydrophobic and polar π-π interactions result in an interesting and alternate selectivity in comparison to C₁₈ and C₈ modified phases.

Through short phenylhexyl chains the NUCLEODUR[®] Phenyl-Hexyl is more polar than the bifunctional modified NUCLEODUR[®] Sphinx RP. Therefore shorter analysis times can be achieved with mixtures of structural similar aromatic and aliphatic unsaturated compounds.

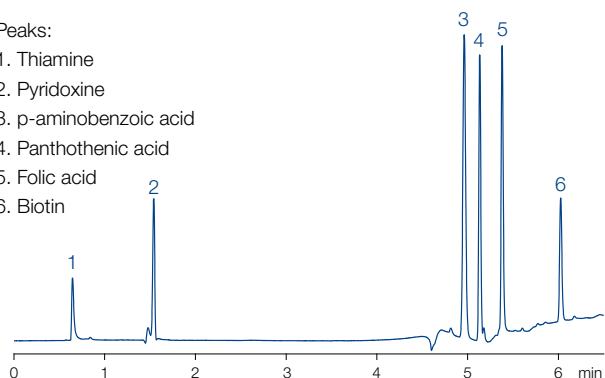

With NUCLEODUR[®] Phenyl-Hexyl e.g., tricyclic antidepressants or water soluble vitamins can be separated in good resolution.

NUCLEODUR[®] π^2 hydrophobic biphenylpropyl phase · USP L11

★ Key feature

- Hydrophobic phase with alternative selectivity compared to classical C₁₈ modifications
- Separation principle based on 2 retention mechanisms (π - π interactions and hydrophobic interactions)
- Better retention of aromatic and unsaturated substances
- Excellent performance under highly aqueous conditions

🔧 Technical data

- Phase with biphenylpropyl modification and multi-endcapping; pore size 110 Å; particle size 5 μ m; carbon content 17 %; pH stability 1.5–10

✓ Recommended application

- Overall sophisticated analytical separations, especially aromatic and unsaturated compounds, polar compounds like pharmaceuticals, antibiotics, steroids

Stationary HPLC phases with biphenyl ligands like NUCLEODUR[®] π^2 provide an interesting alternative to classical alkyl modified C₁₈ and C₈ HPLC phases due to their remarkable orthogonal selectivity.

Furthermore the NUCLEODUR[®] π^2 provides an excellent separation performance for aromatic and unsaturated analytes by combination of hydrophobic and π - π interactions.

A unique feature is the predominant separation mechanism (π - π or hydrophobic interactions) and thus the selectivity can be controlled by selection of the eluent. In acetonitrile/water

NUCLEODUR[®] π^2 shows similar retention strength then C₁₈ modified phases and thereby displays a significantly stronger retention than phenyl phases. These interactions are even further enhanced in a methanol/water eluent.

NUCLEODUR[®] π^2 exceeds other aryl phases in terms of stability under strongly aqueous conditions. Therefore i.a. steroids, sulfonamides and acidic pharmaceuticals are separated in good resolution with NUCLEODUR[®] π^2 . NUCLEODUR[®] π^2 is the stationary phase with the highest aromatic analyte selectivity.

NUCLEODUR[®] PFP hydrophobic pentafluorophenyl phase · USP L43

★ Key feature

- Hydrophobic phase with alternative selectivity in comparison to classical C₁₈ modifications
- Separation principle based on 4 retention mechanisms (polar interactions (H bonds), dipole-dipole, π-π, and hydrophobic interactions)
- Suitable for LC/MS due to low bleeding characteristics

🔧 Technical data

- Phase with pentafluorophenyl-propyl modification and multi-encapsulation; pore size 110 Å; particle sizes 1.8 μm, 3 μm and 5 μm; carbon content 8 %; pH stability 1–9

✓ Recommended application

- Aromatic and unsaturated compounds, phenols, halogen compounds, isomers, polar compounds like pharmaceuticals, antibiotics; strong retention of basic compounds

Orthogonality in selectivity

Fluorinated stationary phases in HPLC have gained increasing interest over the last years. Most common representative of fluorinated silica phases is the pentafluorophenyl modification (PFP or F₅). Especially the orthogonal selectivity compared to traditional alkyl phases widens the scope in analytical HPLC.

Thus NUCLEODUR[®] PFP offers an excellent selectivity especially for highly polar analytes like aromatic and unsaturated compounds, phenols or halogenated hydrocarbons.

While a typical C₁₈ phase just provides hydrophobic interactions between stationary phase and analyte NUCLEODUR[®] PFP offers four different retention mechanisms: polar interactions (H bonds), dipole-dipole, π-π, and hydrophobic interactions. Especially the pronounced ion exchange capacity and distinct steric selectivity are typical for fluorinated phases.

Due to low bleeding characteristics NUCLEODUR[®] PFP is also suitable for LC/MS. Based on a special surface modification procedure NUCLEODUR[®] PFP offers highest stability also at low pH values.

NUCLEODUR[®] PFP offers a completely different retention behavior compared to alkyl modified silica and is often used for separations which provide insufficient results on traditional C₁₈ phases.

Applications in the areas of (bio-)pharma, natural compounds and environment show the broad applicability of this phase.

NUCLEODUR[®] Sphinx RP bifunctional RP phase · USP L1 and L11

★ Key feature

- Distinct selectivity based on well-balanced bifunctional surface coverage
- Widens the scope for method development based on additional π - π interactions
- Suitable for LC/MS due to low bleeding characteristics

🔧 Technical data

- Octadecyl and propylphenyl modified silica; pore size 110 Å; particle sizes 1.8 μ m, 3 μ m and 5 μ m; carbon content 15 %; pH stability 1–10; high reproducibility and consistent quality

✓ Recommended application

- Quinolone antibiotics, sulfonamides, xanthenes, substituted aromatics

Alternative RP selectivity

NUCLEODUR[®] Sphinx RP is characterized by exceptional selectivity features generated by a well-balanced ratio of covalently bonded octadecyl and phenyl groups. The combination of classical hydrophobic with π - π interactions (aromatic ring system) expands the scope of selectivity in comparison with conventional reversed phase packings. NUCLEODUR[®] Sphinx RP is particularly suited for the separation of molecules containing aromatic and multiple bonds.

For the separation of polar compounds NUCLEODUR[®] Sphinx RP can be especially recommended and can also outperform many customary C₁₈ phases. In addition, exhaustive endcapping steps minimize unwanted surface silanol activity and guarantee excellent peak shapes even for strong basic analytes.

Stability of NUCLEODUR[®] Sphinx RP at pH 10

MN Appl. No. 120900

Column: 50 x 4.6 mm NUCLEODUR[®] Sphinx RP, 5 μ m
 Eluent: methanol – dil. NH₃, pH 10 (20:80, v/v)
 Flow rate: 1.0 mL/min, temperature 30 °C
 Detection: UV, 275 nm
 Injection: 3 μ L

Peaks:
 1. Theophylline
 2. Caffeine

Different from standard phenyl phases, NUCLEODUR[®] Sphinx RP is far more stable towards hydrolysis, and is also suggested for LC/MS applications. Due to the additional intermolecular interactions NUCLEODUR[®] Sphinx RP is an interesting replenishment to the high density bonded phases NUCLEODUR[®] C₈/C₁₈ Gravity and the polar endcapped NUCLEODUR[®] C₁₈ Pyramid.

Separation of flavonoids on three different NUCLEODUR[®] phases

MN Appl. No. 119830

Columns: 150 x 4.6 mm
 NUCLEODUR[®] Sphinx RP, 5 μ m
 NUCLEODUR[®] C₁₈ Gravity, 5 μ m
 NUCLEODUR[®] C₈ Gravity, 5 μ m
 Eluent: water – methanol (40:60, v/v)
 Flow rate: 1 mL/min
 Temperature: 30 °C
 Detection: UV, 270 nm
 Injection: 3 μ L

Peaks:
 1. Catechin
 2. Rutin R₁ = R₃ = OH, R₂ = O-Rutinoside
 3. Fisetin R₁ = R₂ = OH, R₃ = H
 4. Quercetin R₁ = R₂ = R₃ = OH
 5. Kaempferol R₁ = H, R₂ = R₃ = OH
 6. Isorhamnetin R₁ = OCH₃, R₂ = R₃ = OH

NUCLEODUR[®] C₁₈ HTec base-deactivated preparative octadecyl phase · USP L1

★ Key feature

- Reliable and durable standard RP phase for up-scaling to preparative scale, suited for LC/MS
- High loading capacity and excellent stability
- Outstanding base deactivation

🔧 Technical data

- High density octadecyl modification (C₁₈); pore size 110 Å; particle sizes 1.8 µm, 3 µm, 5 µm, 7 µm and 10 µm for analytical and preparative separations; carbon content 18 %, pH stability 1–11

✓ Recommended application

- Sophisticated analytical and preparative separations of basic, neutral and acidic pharmaceuticals, derivatized amino acids, pesticides, fat-soluble vitamins, aldehydes, ketones and phenolic compounds

Preparative separations place high demands on silica based HPLC materials. Apart from excellent selectivity and base deactivation, robustness (pH, pressure stability, ...) and capacity are vital criteria for optimal and efficient separation at the preparative scale.

Selectivity and base deactivation

The innovative endcapping procedure leads to exceptionally good base deactivation – the Engelhardt test demonstrates superb selectivity, peak symmetry and peak shape over the entire polarity range. In addition NUCLEODUR[®] C₁₈ HTec scores in low bleed characteristics and is therefore highly suitable for LC/MS.

Stability and lifetime

Based on fully synthetic and extremely robust totally spherical NUCLEODUR[®] silica, NUCLEODUR[®] C₁₈ HTec offers outstanding mechanical rigidity and is thus the perfect choice also for self-packing of prep-columns. The special surface modification and endcapping procedure results in high chemical stability even at extreme chromatographic conditions like high flow rates, temperature or critical solvents (DMSO). Furthermore, NUCLEODUR[®] C₁₈ HTec columns show a remarkably long lifetime in acidic (pH 1) as well as basic (pH 10) mobile phases.

Due to innovative surface coating procedures NUCLEODUR[®] C₁₈ HTec offers excellent analytical separation properties and is the first choice for up-scaling to preparative column dimensions.

Up-scaling

Due to highest quality standards in silica production and phase chemistry combined with optimized packing technology, NUCLEODUR[®] C₁₈ HTec allows exceptional transferability from analytical to preparative scale with respect to different particle sizes (e.g., 5, 7 or 10 µm) as well as column dimensions (e.g., ID 4.6 to 21 mm).

Up-scaling with NUCLEODUR[®] C₁₈ HTec

MN Appl. No. 123780

Columns: EC 250 x 4,6 mm NUCLEODUR[®] C₁₈ HTec, 5 µm
 VP 250 x 21 mm NUCLEODUR[®] C₁₈ HTec, 5 µm
 Eluent: acetonitrile – water (80:20, v/v)
 Flow rate: 1.3 mL/min / 27 mL/min
 Temperature: 22 °C
 Pressure: 84 bar / 109 bar
 Detection: UV, 254 nm
 Injection: 3 µL / 60 µL

Peaks: (1 mg/mL each)

1. Phenol
2. Naphthalene
3. Anthracene

Capacity

A vital criterion for efficiency in preparative HPLC is the capacity of the separation medium. NUCLEODUR[®] C₁₈ HTec is characterized by a notably high loading capacity under both basic and acidic conditions, while competitor columns show overload effects even at lower loads (x).

Loading capacity under acidic conditions

MN Appl. No. 123890

Columns: VP 100 x 21 mm NUCLEODUR[®] C₁₈ HTec, 5 µm
 100 x 21.2 mm AXIA™ Gemini[®] 5 µm C18 110 Å

NUCLEODUR[®] C₁₈ ec · C₈ ec · C₄ ec nonpolar phases for routine analysis · USP L1 (C₁₈) · L7 (C₈) · L26 (C₄)

★ Key feature

- Ideal and reliable standard RP phase for daily routine analysis and up-scaling for preparative HPLC
- Medium density Octadecyl (C₁₈) and octyl (C₈) with pore size of 110 Å with exhaustive endcapping for a wide range of applications
- Octadecyl (C₁₈) and butyl (C₄) with pore size of 300 Å for the separation of biomolecules

🔧 Technical data

- Pore size 110 Å: particle sizes 3 µm and 5 µm, 7 µm, 10 µm, 12 µm, 16 µm, 20 µm, 30 µm and 50 µm for preparative separations; carbon content 17.5 % for C₁₈, 10.5 % for C₈; pH stability 1–9; high reproducibility from lot to lot
- Pore size 300 Å: technical data and applications in chapter “HPLC column for biochemical separations” (see page 241)

✓ Recommended application

- 110 Å: basic, neutral or acidic drugs; derivatized amino acids; pesticides; fat-soluble vitamins; aldehydes and ketones; phenolic compounds
- 300 Å: biomolecular macromolecules, like proteins and peptides

NUCLEODUR[®] C₁₈ ec for daily routine analysis

The efficiency of a separation is controlled by particle size and selectivity of the stationary phase. The exceptional surface coverage of monomeric bonded alkylsilanes, combined with an exhaustive endcapping, results in a surface with lowest silanol activity. This allows the tailing-free elution of polar compounds such as basic drugs. NUCLEODUR[®] C₁₈ ec is available in 9 different particle sizes (3, 5, 7, 10, 12, 16, 20, 30 and 50 µm) which cover the whole range from high speed analytical HPLC up to medium and low pressure prep LC. NUCLEODUR[®] C₁₈ ec is also an ideal tool for scale-up purposes.

Loading capacity

Loading capacity, probably the most important feature for preparative LC applications, is determined by pore size, pore volume and surface area of the packing. However, it can also be influenced by the molecular weight of the analytes. In the figure below the mass loading curve for acetophenone and butyrophenone on a NUCLEODUR[®] 100-20 C₁₈ ec column describes the correlation between the increase of column loading and the decrease of separation efficiency.

pH stability of NUCLEODUR[®] C₁₈ ec

Separation of theophylline and caffeine at pH 10

Column: 30 x 3 mm NUCLEODUR[®] 100-5 C₁₈ ec
 Eluent: methanol – aq. NH₃ (20:80, v/v), pH 10
 Flow rate: 0.5 mL/min
 Temperature: 25 °C
 Detection: UV, 254 nm

Separation of uracil, veratrol, toluene and ethylbenzene at pH 1.5

Column: 30 x 3 mm NUCLEODUR[®] 100-5 C₁₈ ec
 Eluent: acetonitrile – H₂O (65:35, v/v), TFA, pH 1.5
 Flow rate: 1.0 mL/min
 Temperature: 25 °C
 Detection: UV, 254 nm

Chemical stability

The utmost purity of the base silica and the exceptional silane bonding chemistry minimize the risk of dissolution, or hydrolysis at pH extremes.

The chromatograms show the retention behavior at pH values of 1.5 and 10.0 for NUCLEODUR® 100-5 C₁₈ ec.

NUCLEODUR® octyl phases

In addition to NUCLEODUR® C₁₈ phases MACHEREY-NAGEL offers octyl modified NUCLEODUR® C₈ Gravity and NUCLEODUR® C₈ ec columns to expand the RP tool box. Based on the same spherical high purity silica the C₈ phases exhibit the same chemical and mechanical stability as the C₁₈ counterparts. Indeed NUCLEODUR® C₈ Gravity can also be run at pH extremes (pH 1–11) by choosing appropriate elution parameters. Due to the shorter chain and less hydrophobic properties of the stationary phase the retention of non-polar compounds is decreased, and in consequence a reduction in time of analysis can be achieved. Moreover a stronger polar selectivity, particularly with the separation of ionizable analytes is frequently observed (as distinct from the C₁₈ phases). NUCLEODUR® C₈ ec and NUCLEODUR® C₈ Gravity are most suitable for the development of new methods but also for robust routine analyses.

There are no general guidelines which could make the choice between C₈ and C₁₈ phases easier but it will always be beneficial to add both phases to the existing pool of RP columns in the laboratory. Comparative studies reveal some different selectivity patterns of NUCLEODUR® C₈ ec and C₁₈ ec. The separation of phenols at right shows baseline separation for 2-ethoxyphenol and dimethoxybenzene (veratrol) and in addition a reversal of the elution order of phenol and 4-methoxyphenol can be shown on the octyl phase.

NUCLEODUR® phases for biochromatography

A description and applications for C₁₈ and C₄ modified 300 Å NUCLEODUR® widepore materials for the separation of biopolymers, like peptides and proteins can be found in chapter “HPLC column for biochemical separations” (see page 241).

C₁₈ or C₈ · the best of both worlds

- Octyl phases (C₈) show superior polar selectivity.
- Octadecyl phases (C₁₈) show superior hydrophobic selectivity.
- Hydrophobic compounds show shorter retention times on C₈ phases.

NUCLEODUR® HILIC zwitterionic phase

★ Key feature

- Ideal for reproducible and stable chromatography of highly polar analytes
- Suitable for analytical and preparative applications
- Very short column conditioning period

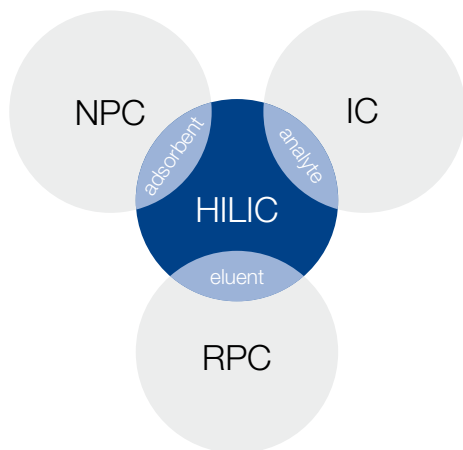

🔧 Technical data

- Ammonium - sulfonic acid modified silica; pore size 110 Å; particle sizes 1.8, 3 and 5 µm; carbon content 7 %; pH stability 2–8.5

✓ Recommended application

- Hydrophilic compounds such as organic polar acids and bases, polar natural compounds, nucleosides, oligonucleotides, amino acids, peptides, water soluble vitamins

Hydrophilic interaction chromatography

Retention characteristic

Commonly HILIC is described as partition chromatography or liquid-liquid extraction system between mobile and stationary phases. Versus a water-poor mobile phase a water-rich layer on the surface of the polar stationary phase is formed. Thus, a distribution of the analytes between these two layers will occur. Furthermore HILIC includes weak electrostatic mechanisms as well as hydrogen donor interactions between neutral polar molecules under high organic elution conditions. This distinguishes HILIC from ion exchange chromatography - main principle for HILIC separation is based on compound's polarity and degree of solvation.

Especially for polar compounds reversed phase HPLC – the most common analytical method – is often limited. Here, hydrophilic stationary phases provide an additional tool for the separation of polar analytes in HPLC.

The expression HILIC (Hydrophilic Interaction Chromatography) was firstly published by Andrew Alpert in 1990 – since then it took quite some efforts to develop robust and reproducible hydrophilic HPLC phases for HILIC chromatography [7].

HILIC combines the characteristics of the 3 major methods in liquid chromatography – reversed phase (RPC), normal phase (NPC) and ion chromatography (IC):

- Stationary phases (adsorbents) are mostly polar modifications of silica or polymers (SiOH, NH₂, Diol, (zwitter) ions, ...) – like in NPC.
- Mobile phases (eluents) are mixtures of aqueous buffer systems and organic modifier like acetonitrile or methanol - like in RPC.
- Fields of application include quite polar compounds as well as organic and inorganic ions – like in IC.

Summarized: "HILIC is NP chromatography of polar and ionic compounds under RP conditions."

NUCLEODUR® HILIC is a special zwitterionic modified stationary phase based on ultra spherical NUCLEODUR® particles. The betaine character of the ammoniumsulfonic acid ligands results in total charge equalization and in an overall neutrally charged but highly polar surface

Separation of uracil and naphthalene

MN Appl. Nos. 122911 / 122912

Columns: A) 125 x 4 mm NUCLEODUR® C₁₈ Pyramid, 3 µm
B) 125 x 4 mm NUCLEODUR® HILIC, 3 µm
Eluent: acetonitrile – water (90:10, v/v)
Flow rate: 1.0 mL/min, temperature 25 °C
Detection: UV, 254 nm

Peaks:
1. Uracil
2. Naphthalene

More polar compounds will have stronger interaction with the stationary aqueous layer than less polar compounds – resulting in a stronger retention. Nonpolar compounds exhibit faster elution profiles due to minor hydrophobic interactions. In the separation of uracil and naphthalene the elution order is quite often inverse on HILIC columns compared to RP columns.

Stability features

Due to an advanced and unique surface modification procedure (pat. pend.) NUCLEODUR[®] HILIC columns provide short equilibration times – after just 20 min equilibration already the 2nd injection shows stable and reproducible results.

Beyond this, NUCLEODUR[®] HILIC columns are characterized by an outstanding column life time - even after nearly 800 runs the columns show no loss of pristine performance - peak shape and retention are still immaculate. Due to its high loading capacity NUCLEODUR[®] HILIC is absolutely suitable for preparative and semi-preparative applications.

Overall NUCLEODUR[®] HILIC provides excellent chromatographic features and is hereby the perfect choice for separation of polar or charged compounds.

NUCLEODUR[®] CN / CN-RP cyano-modified high purity silica phase · USP L10

★ Key feature

- High retention capacity especially for very polar and unsaturated compounds
- Multi-mode column (RP and NP) widens scope of selectivity
- Stable against hydrolysis at low pH (working range pH 1–8)

🔧 Technical data

- Cyanopropyl-modified high purity silica; pore size 110 Å; particle sizes 3 µm and 5 µm; carbon content 7 %; special endcapping
- High reproducibility from lot to lot; different retention characteristics in comparison to C₈ and C₁₈

✓ Recommended application

- Tricyclic antidepressants, steroids, organic acids

Alternative bonded-phase functionality

In reversed phase HPLC it is fairly common to start with C₁₈ or C₈ columns, if new methods have to be developed. However, superior polarity and selectivity properties often required for more sophisticated separations, are not always sufficiently provided by classical RP phases, which are usually characterized by a hydrophobic layer of monomeric or polymeric bonded alkylsilanes.

One approach to improve the resolution of compounds poorly separated on nonpolar stationary phases, is to change bonded-phase functionality.

The fully endcapped and highly reproducible NUCLEODUR[®] 100-5 CN-RP phase has cyanopropyl groups on the surface able to generate a clearly recognizable different retention behavior compared to purely alkyl-functionalized surface modifications (see figure below).

The polarity of NUCLEODUR[®] 100-5 CN-RP can be classified as intermediate based on multiple retention mechanisms such as dipole-dipole, π-π, and also hydrophobic interactions [8]. Therefore, this phase shows a distinct selectivity for polar organic compounds as well as for molecules containing π electron systems (e.g., analytes with double bonds, tricyclic antidepressants) [9].

Short-chain bonded phases are sometimes suspected of revealing shortcomings in stability towards hydrolysis at low pH [10]. Application 119350 shows that even after 100 sample injections and four weeks storage at pH 1 (blue curve), neither a considerable shift in retention, nor a visible change in peak symmetry could be noticed (green curve = new column)

Separation of cold medicine ingredients on two different NUCLEODUR[®] phases

MN Appl. No. 119340

Columns: 250 x 4 mm NUCLEODUR[®] 100-5 C₁₈ ec
250 x 4 mm NUCLEODUR[®] 100-5 CN-RP
Eluent: acetonitrile – 100 mmol/L sodium citrate pH 2.5 (15:85, v/v)
Flow rate: 1.0 mL/min, temperature 25 °C
Detection: UV, 254 nm, injection 10 µL

Peaks:

1. Maleic acid
2. Norephedrine
3. Ephedrine
4. Acetaminophen
5. Chlorpheniramine
6. Brompheniramine

Stability of NUCLEODUR[®] CN-RP at pH 1

MN Appl. No. 119350

Columns: 125 x 4 mm NUCLEODUR[®] 100-5 CN-RP
Eluent: acetonitrile – water, 2 % TFA pH 1 (50:50, v/v)
Flow rate: 1.0 mL/min
Temperature: 25 °C
Detection: UV, 254 nm
Injection: 5 µL

Peaks:

1. Benzamide
2. Dimethyl phthalate
3. Phenetole
4. o-Xylene
5. Biphenyl

Multi-mode columns

Due to its polarity the cyano phase can also be run in normal phase mode. NUCLEODUR® CN columns for NP applications are shipped in *n*-heptane. The change in selectivity and order of elution for a mixture of various steroids in NP and RP mode is

displayed below. The high coverage combined with a thorough endcapping makes NUCLEODUR® 100-5 CN-RP suitable for separation of ionizable compounds such as basic drugs.

NUCLEODUR[®] NH₂ / NH₂-RP amino-modified high purity silica · USP L8

★ Key feature

- Multi-mode columns (for RP, NP and IC)
- Stable against hydrolysis at low pH (working range pH 2–8), 100 % stable in water; suitable for LC/MS
- Widens scope of analytical HPLC into the polar range

🔧 Technical data

- Aminopropyl modified high purity silica; pore size 110 Å; particle sizes 3, 5 and 7 µm; carbon content 2.5 %; not endcapped

✓ Recommended application

- Polar compounds under RP conditions (sugars, DNA bases), hydrocarbons under NP conditions

- Normal phase chromatography (NP) with hexane, dichloromethane or 2-propanol as mobile phase for polar compounds such as substituted anilines, esters, chlorinated pesticides
- Reversed phase chromatography (RP) of polar compounds in aqueous-organic eluent systems
- Ion exchange chromatography of anions and organic acids using conventional buffers and organic modifiers

Some compounds, especially polar substances, cannot be sufficiently resolved on C₁₈ phases. Polar-modified silica phases offer alternative selectivities thus expanding the spectrum of analytical HPLC into the polar range.

Multi-mode columns

Besides cyano modifications, amino modifications belong to the most frequently used polar silica phases – both feature the important advantage, that they can be run in the RP mode using aqueous-organic eluent mixtures as well as in the NP mode, e.g., with hexane as mobile phase.

Reversed phase separation of sugars

MN Appl. No. 122160

Column: 250 x 4 mm NUCLEODUR[®] 100-5 NH₂-RP
 Eluent: acetonitrile – water (79:21, v/v)
 Flow rate: 2 mL/min
 Detection: RI

- Peaks:
1. Fructose
 2. Glucose
 3. Saccharose
 4. Maltose
 5. Lactose

NUCLEODUR[®] NH₂, too, belongs to the so-called multimode columns. It can be used for RP chromatography of polar compounds such as sugars in aqueous-organic eluent systems, for NP chromatography of substituted aromatics or chlorinated pesticides with organic mobile phases such as hexane, dichloromethane or 2-propanol, but also for ion exchange chromatography of anions and organic acids using conventional buffers and organic modifiers.

Main field of application of NUCLEODUR[®] NH₂ is the separation of simple and complex sugars, sugar alcohols and other hydroxy compounds under RP conditions as well as hydrocarbons under NP conditions.

Normal phase separation of middle distillates in accordance with DIN EN 12916

MN Appl. No. 122180

Columns: A) 250 x 4 mm NUCLEODUR[®] 100-5 NH₂
 B) conventional aminopropyl phase
 Eluent: heptane
 Flow rate: 1 mL/min
 Detection: RI

Peaks:

1. Cyclohexane
2. 1-Phenyldodecane
3. 1,2-Dimethylbenzene
4. Hexamethylbenzene
5. Naphthalene
6. Dibenzothiophene
7. 9-Methylantracene

Due to the special method of surface modification NUCLEODUR[®] NH₂ features a pronounced stability at higher as well as at lower pH values. The following figure shows, that even after several days of exposure of the column material at pH 1.75 good separation efficiency and peak symmetry are maintained. The resulting high column life allows cost reduction due to lower column consumption.

This example shows the enhanced pH stability of NUCLEODUR[®] NH₂ and the outstanding suitability for the separation of total herbicides (AMPA, glyphosate, glufonisate, ...) - see application 122190 in our online data base at www.mn-net.com/apps.

Hydrolytical resistance of NUCLEODUR® NH₂-RP

Column: 250 x 4 mm NUCLEODUR® 100-5 NH₂-RP
 Eluent: acetonitrile – 50 mmol/L KH₂PO₄, pH 1.75 (50:50, v/v)
 Flow rate: 0.6 mL/min
 Detection: UV, 254 nm

Peaks:
 1. Aminomethylphosphonic acid (AMPA)

after 3872 min
 1st injection

Separation of DNA bases

MN Appl. No. 122170

Column: 250 x 4 mm
 NUCLEODUR®
 100-5 NH₂-RP
 Eluent: acetonitrile – water (80:20, v/v)
 Flow rate: 0.6 mL/min
 Temperature: 35 °C
 Pressure: 30 bar
 Detection: UV, 254 nm

Peaks:
 1. Thymine
 2. Uracil
 3. Cytosine
 4. Adenine

Based on superspherical NUCLEODUR® this phase features a high pressure stability, which makes it the perfect choice for preparative separations as well as for LC/MS. Additionally, the high batch-to-batch reproducibility of NUCLEODUR® NH₂ enables reliable analyses especially for routine work.

Core-shell technology

Key feature

- Solid core of silicon dioxide, homogeneous shell of porous silica
- Highest efficiency compared to traditional totally porous materials
- Pore size 90 Å; particle size 2.7 µm (core 1.7 µm) and 5 µm (core 3.8 µm); specific surface 130 (2.7 µm) and 90 (5 µm) m²/g lower back pressure enables use on conventional LC systems
- Pressure stability 600 bar

Demands on HPLC separations are constantly increasing with respect to separation efficiency, detection limits, and the time requirements for each analysis.

Several approaches have been made to achieve fast separations without losing chromatographic performance. HPLC columns packed with particles < 2 µm show very high efficiencies (plates/meter) and allow the use of smaller column sizes with the positive side effect of significant solvent saving. However they generate a high back pressure of the mobile phase during column runs which requires specifically designed equipment.

Electron microscopic image of NUCLEOSHELL®

NUCLEOSHELL® silica particles consist of a non-porous solid core of 1.7 µm diameter and a porous outer shell of 0.5 µm thickness. Accordingly the total diameter of the particle is 2.7 µm.

Utilizing a proprietary process of synthesis, NUCLEOSHELL® particles exhibit a distinct narrow particle size distribution (d₉₀/d₁₀ ~ 1.1). Columns packed with NUCLEOSHELL core shell particles feature exceptional separation efficiencies with theoretical plate numbers easily comparable to totally porous sub 2 micron particles.

$$R_s = \frac{\sqrt{N}}{4} \left(\frac{\alpha - 1}{\alpha} \right) \left(\frac{k'_i}{k'_i + 1} \right)$$

R_s = resolution, α = selectivity (separation factor), k'_i = retention
 N = plate number with $N \propto 1/d_p$, d_p = particle diameter

Resolution R_s as function of particle size

	3	1	7.5	133 333	150	20 000	100 %	60 %
	5	1	12.5	80 000	250	20 000	100 %	100 %

Benefits of core-shell technology

Core-shell particles vs. totally porous silica

Short diffusion paths

- Fast mass transfer (term C of Van Deemter equation)
- High flow velocity without peak broadening for fast LC

Narrow particle size distribution (d₉₀/d₁₀ ~ 1.1)

- Stable packing

High heat transfer

- Minimized influence of frictional heat
- Efficiency of NUCLEOSHELL® ~ 250 000 m⁻¹ (HETP ~ 4 μm)

With conventional fully porous particles the mass transfer between stationary and mobile phase usually results in peak broadening at higher flow rates (C-term in van Deemter equation). The short diffusion paths in the core-shell particles reduce the

dwelt time of the analyte molecules in the stationary phase, so that even at high flow velocities of the mobile phase, optimal separation results can be obtained.

The van Deemter plots demonstrate how efficiency is affected by flow rate.

In comparison with fully porous silicas, core-shell particles from various manufacturers maintain the efficiency optimum (max. plates/m) over a long range of increasing linear mobile phase velocity.

$$H = A + \frac{B}{u} + C \cdot u$$

A term = eddy-diffusion, B term = longitudinal diffusion coefficient, C term = mass transfer coefficient

Van Deemter curves

MN Appl. No. 125500

 Sample: Acenaphthene

NUCLEOSHELL® core-shell silica for HPLC

In direct comparison with conventional sub 2 micron phases, NUCLEOSHELL® columns only generate about 60% of the back pressure and can be operated with the majority of conventional HPLC systems. In order to develop the maximum performance of NUCLEOSHELL® columns, we recommend reducing extra column voids by using suitable capillaries (< 0.15 mm inner diameter) and specially adapted detector cells. Moreover detector settings should be optimized by increasing the measuring rate or by decrease of the time constant.

$$\Delta_p = \frac{\Phi \cdot L_C \cdot \eta \cdot u}{d_p^2}$$

Δ_p = pressure drop, Φ = flow resistance (nondimensional), L_C = column length, η = viscosity, u = linear velocity, d_p = particle diameter

Core-shell particle technology from MACHEREY-NAGEL is an alternate route to gain highest column efficiency and resolution in HPLC at short run time, but with moderate back pressure.

Features of NUCLEOSHELL® particles

A criterion for the long-term stability of the column at pH extremes is the percentage decrease of initial retention and initial plates, respectively.

The following figure shows a column stability test of NUCLEOSHELL® RP 18 at mobile phase levels pH 1 and pH 10 compared with three competing phases.

NUCLEOSHELL® core-shell silica for HPLC

Columns can be operated at elevated temperatures without loss in retention, efficiency or peak symmetry.

Uniformly shaped NUCLEOSHELL® particles combined with optimized bonding technology safeguard tightly packed columns for 100 % reproducible results.

Peak capacity

The peak capacity is a measure for the number of sample analytes that can be separated on HPLC columns per time unit. Narrow peaks increase the peak capacity and thus the efficiency of the analytical column.

The example shows, that in comparison with totally porous NUCLEODUR® silica (1.8 µm) NUCLEOSHELL® provides 33 % higher peak capacity.

Peak capacity
 MN Appl. No. 125540

Columns: 100 x 4.6 mm each
 NUCLEOSHELL® RP 18, 2.7 µm
 NUCLEODUR® C₁₈ Gravity, 1.8 µm

Eluent: A) acetonitrile, B) water, 40–100 % A in 4 min
 Flow rate: 1.5 mL/min
 Temperature: 25 °C
 Detection: UV, 230 nm

Peaks:
 1. Acetophenone
 2. Benzoin
 3. Propiophenone
 4. Butyrophenone
 5. Benzophenone
 6. Valerophenone

	Max. pressure [bar]	Resolution (4.5)
NUCLEOSHELL®, 2.7 µm	255	5.45
NUCLEODUR®, 1.8 µm	450	4.14
NUCLEODUR®, 3 µm	214	2.97
NUCLEODUR®, 5 µm	142	2.30

Loading capacity

NUCLEOSHELL® columns allow reliable quantification in a wide analytical detection range. Retention time and peak width at 50 % height remain constant with increasing columns load although core-shell particles are suspected of showing a slightly lower loading capacity compared to fully porous silica materials.

Method transfer of 5 µm particle columns

NUCLEOSHELL® is also available in 5 µm particle size to offer all benefits of core-shell technology to all applications which are bound to particle size.

NUCLEOSHELL® RP 18 nonpolar high density phase · USP L1

★ Key feature

- Core-shell technology for fast and efficient HPLC
- Suitable for LC/MS and HPLC at pH extremes (pH 1–11)
- Superior base deactivation, ideal for method development

🔧 Technical data

- Octadecyl modification, multi-end-capped; pore size 90 Å, particle size 2.7 and 5 µm, carbon content 7.8 % for 2.7 µm, 6.1 % for 5 µm; pH stability 1–11; suitable for LC/MS

✓ Recommended application

- Overall sophisticated analytical separations, e.g., analgesics, anti-inflammatory drugs, antidepressants; herbicides; phytopharmaceuticals; immunosuppressants

NUCLEOSHELL® RP 18 is based on core-shell silica. A unique derivatization process generates a homogeneous surface with a high density of bonded silanes. The following thorough endcapping suppresses any unwanted polar interactions between the silica surface and the sample, which makes NUCLEOSHELL® RP 18 particularly suitable for the separation of basic and other

ionizable analytes. The extremely reduced silanol activity of the phase can be demonstrated by applying basic analytes, such as tricyclic antidepressants. The chromatogram below shows a sharp elution profile (superior resolution!) of these highly polar compounds with an excellent asymmetry value for amitriptyline of 1.12.

Poroshell®	1.05	1.95

NUCLEOSHELL® RP 18 combines innovative silica technology and excellent surface deactivation, that outperforms conventional C₁₈ silicas in terms of efficiency, resolution and speed.

Due to the applied core-shell particle design the back pressure at elevated flow rates remains at a moderate level and in many cases permits the use of existing HPLC equipment. NUCLEOSHELL® RP 18 with extended pH stability, low bleed

characteristics in LC/MS applications, and overall robustness is an ideal tool for method development and routine analyses in modern HPLC.

The separation of 13 β-lactam antibiotics illustrates how time of analysis can be shortened to a fractional part by using core-shell particles without loss of resolution at moderate back pressure.

NUCLEOSHELL® RP 18plus C₁₈ phase with polar selectivity · USP L1

★ Key feature

- Based on core-shell particle technology for fast and efficient HPLC
- Hydrophobic C₁₈ phase with distinct polar selectivity, ideal for method development
- Excellent performance under highly aqueous conditions

🔧 Technical data

- Monomeric octadecyl modification, multi-encapped; pore size 90 Å, available particle sizes 2.7 µm and 5 µm, carbon content 5.7 % for 2.7 µm, 4.4 % for 5 µm; pH stability 2–9; suitable for LC/MS

✓ Recommended application

- Overall sophisticated analytical separations, especially for polar compounds, e.g., pharmaceuticals like antibiotics, water-soluble vitamins, organic acids

NUCLEOSHELL® RP 18plus is a C₁₈ modified core-shell silica. Due to a monomeric bonding chemistry this HPLC phase offers hydrophobic characteristics with distinct polar selectivity. A special derivatization process generates a medium density of bonded silanes with reduced steric selectivity compared to NUCLEOSHELL® RP 18.

Bleeding characteristics

MN Appl. No. 126640

Column: 50 x 2 mm NUCLEOSHELL® RP 18plus, 2.7 µm
Eluent: A) 0.1 % formic acid in water
B) 0.1 % formic acid in acetonitrile
95 % A → 5 % A in 4.5 min (0.5 min) → 95 % A in 0.5 min (4.5 min)
Flow rate: 0.5 mL/min
Temperature: 25 °C
Detection: MS

NUCLEOSHELL® RP 18plus combines superbly hydrophobic and polar selectivity – so it is a useful tool for method development in RP chromatography. Good pH stability and low bleeding characteristics make it ideal especially for LC/MS applications.

pH stability of NUCLEOSHELL® RP 18plus

MN Appl. No. 126650

Column: 100 x 4 mm NUCLEOSHELL® RP 18plus, 2.7 µm
Eluent pH 1: 1 % TFA in water - acetonitrile (50:50, v/v)
Eluent pH 9: 50 mmol/L triethylammonium acetate adjusted to pH 9
Flow rate: for pH 1: 0.8 mL/min, for pH 9: 0.56 mL/min
Temperature: for pH 1: 60 °C, for pH 9: 50 °C
Detection: UV, 254 nm
Injection: 1 µL

Also a comparison of retention of the glycopeptide antibiotic vancomycin on several octadecyl modified core-shell phases underlines the polar selectivity of NUCLEOSHELL® RP 18plus.

Polar selectivity shown for vancomycin

MN Appl. No. 126660

Columns: 50 x 3 mm each
 NUCLEOSHELL® RP 18plus, 2.7 µm
 NUCLEOSHELL® RP 18, 2.7 µm
 Kinetex® 2.6 µm C18

Eluent: water – methanol – acetonitrile – glacial acetic acid (100:8:2:0.3, v/v/v/v) adjusted to pH 3.2 with sodium hydroxide solution

Flow rate: 0.9 mL/min
 Temperature: 35 °C
 Detection: UV, 240 nm
 Injection: 10 µL

In addition NUCEOSHELL® RP 18plus provides a good stability under highly aqueous conditions. Even by long term usage or storage of the phase phase collapse and loss of retention are hardly observed. The original performance can be regained after a short regeneration procedure.

NUCLEOSHELL® Phenyl-Hexyl nonpolar high density phase · USP L11

★ Key feature

- Based on core-shell particle technology for fast and efficient HPLC
- Hydrophobic phase with alternative selectivity compared to classical C₁₈ modifications
- Separation principle based on 2 retention mechanisms: π-π interactions and hydrophobic interactions

🔧 Technical data

- Phenyl-Hexyl modification, multi-end-capped; pore size 90 Å, particle size 2.7 μm; carbon content 4.5 %; pH stability 1–10; suitable for LC/MS

✓ Recommended application

- Aromatic and unsaturated compounds, polar compounds like pharmaceuticals, antibiotics

Phenyl-Hexyl modified phases offer an excellent separation efficiency especially for aromatic and unsaturated compounds with electron-withdrawing groups. The combination of hydrophobic and π-π interactions results in an alternative and interesting selectivity profile compared to C₁₈ or C₈ modifications. NUCLEOSHELL® Phenyl-Hexyl is based on a unique surface bonding chemistry - therefore it is suitable for LC/MS due to low bleeding characteristics and offers high temperature stability and pH stability from 1 to 10.

Stability of NUCLEOSHELL® Phenyl-Hexyl at pH 10

MN Appl. No. 126420

Column: 50 x 4 mm NUCLEOSHELL® Phenyl-Hexyl, 2.7 μm

3. Anthracene

Relative plate numbers

NUCLEOSHELL® Phenyl-Hexyl is a robust phase with an alternative RP selectivity for aromatic and unsaturated analytes compared to classical C₁₈ / C₈ phases – it is an additional and useful tool for all chromatography users.

Bleeding characteristics of NUCLEOSHELL® Phenyl-Hexyl

MN Appl. No. 126400

Columns: 50 x 2 mm each
NUCLEOSHELL® Phenyl-Hexyl, 2.7 μm
Kinetex® Phenyl-Hexyl
Eluent: A) acetonitrile, B) water
5–95 % A in 25 min
Flow rate: 0.2 mL/min
Temperature: 25 °C
Detection: MS

The pyridine-phenol test shows that NUCLEOSHELL® Phenyl-Hexyl provides a symmetrical peak for pyridine and higher resolution in comparison to other core-shell based Phenyl-Hexyl phases, which underlines the excellent base deactivation.

Pyridine-phenol test of NUCLEOSHELL® Phenyl-Hexyl

MN Appl. No. 126410

Columns: 50 x 2 mm each
NUCLEOSHELL® Phenyl-Hexyl, 2.7 μm
Kinetex® Phenyl-Hexyl
Ascentis® Express Phenyl-Hexyl
Eluent: acetonitrile – water (70:30, v/v)
Flow rate: 0.3 mL/min
Temperature: 40 °C
Detection: UV, 254 nm
Injection: 0.2 μL

- Peaks:
1. Pyridine
 2. Phenol

Comparing the separation of sulfonamides on NUCLEODUR® Phenyl-Hexyl with different particle sizes

MN Appl. No. 125860

Columns: 150 x 3 mm each
 NUCLEOSHELL® Phenyl-Hexyl, 2.7 µm
 NUCLEODUR® Phenyl-Hexyl, 1.8 µm
 NUCLEODUR® Phenyl-Hexyl, 3 µm
 NUCLEODUR® Phenyl-Hexyl, 5 µm

Eluent: A) methanol
 B) 0.1 % formic acid in water
 20–80 % A in 10 min

Flow rate: 0.56 mL/min
 Temperature: 40 °C
 Detection: UV, 254 nm
 Injection: 0.5 µL

- Peaks:
1. Sulfadiazine
 2. Sulfachlorpyridazine
 3. Sulfapyridine
 4. Sulfamerazine
 5. Sulfadimidine
 6. Sulfathiazole
 7. Sulfadimethoxine

On NUCLEOSHELL® Phenyl-Hexyl the resolution of the last two peaks is higher than on the fully porous 1.8 µm NUCLEODUR® Phenyl-Hexyl.

The separation of sulfonamides proves the scalability from fully porous NUCLEODUR® to NUCLEOSHELL® Phenyl-Hexyl. Hereby the core-shell silica exhibits identical selectivity, narrower peaks and slightly shorter retention under the same conditions.

Thus, method transferability between NUCLEODUR® and NUCLEOSHELL® is guaranteed, either for speeding up your methods or scaling up for preparative requirements.

NUCLEOSHELL® PFP hydrophobic pentafluorophenyl phase · USP L43

★ Key feature

- Core-shell technology for fast and efficient HPLC
- Hydrophobic phase with alternative selectivity in comparison to classical C₁₈ modifications
- Separation principle based on 4 retention mechanisms (polar interactions (H bonds), dipole-dipole, π-π, hydrophobic interactions)

🔧 Technical data

- Phase with pentafluorophenylpropyl modification, multi-endcapping; pore size 90 Å, particle size 2.7 µm; carbon content ~ 3%; pH stability 1–9; suitable for LC/MS

✓ Recommended application

- Aromatic and unsaturated compounds, phenols, halogen compounds, isomers, polar compounds like pharmaceuticals, antibiotics; strong retention of basic compounds

Orthogonality in selectivity

Fluorinated stationary phases in HPLC have gained increasing interest over the last years. Most common representative of fluorinated silica phases is the pentafluorophenyl modification (PFP or F₅). Especially the orthogonal selectivity compared to traditional alkyl phases widens the scope in analytical HPLC. Thus NUCLEOSHELL® PFP offers an excellent selectivity especially for highly polar analytes, aromatic and unsaturated compounds, phenols or halogenated hydrocarbons.

While a typical C₁₈ phase just provides hydrophobic interactions between stationary phase and analyte NUCLEOSHELL® PFP offers four different retention mechanisms: polar interactions (H bonds), dipole-dipole interactions, π-π interactions and hydrophobic interactions. Especially the pronounced ion exchange capacity and distinct steric selectivity are typical for the character of fluorinated phases.

Stability of NUCLEOSHELL® PFP at pH 1

MN Appl. No. 125560

Columns: 100 x 4.6 mm NUCLEOSHELL® PFP, 2.7 µm
100 x 4.6 mm Kinetex® PFP, 2.6 µm F5

NUCLEOSHELL® HILIC zwitterionic phase

★ Key feature

- Core-shell technology for fast and efficient HPLC
- Ideal for reproducible and stable chromatography of highly polar analytes
- Very short column equilibration times

🔧 Technical data

- Ammonium - sulfonic acid modified silica; pore size 90 Å, particle size 2.7 µm; carbon content 1.3 %; pH stability 2–8.5; suitable for LC/MS

✓ Recommended application

- Hydrophilic compounds such as polar organic acids and bases, polar natural compounds, nucleosides, oligonucleotides, amino acids, peptides, water-soluble vitamins

Hydrophilic interaction chromatography

Hydrophilic interaction chromatography (HILIC) is a separation technique using polar stationary phases and organic-aqueous mobile phases. A minimum water content of at least 2 % is indispensable to provide a permanent water layer between the adsorbent surface and the organic fraction of the mobile phase. The sample molecules become separated in a partition chromatography, in which polar analytes are more strongly retained than neutral, less hydrophilic compounds. Consequently, increasing the aqueous part in the mobile phase will diminish retention of the polar sample constituents. In this way HILIC behaves inverse to classical RP chromatography. The particular retention profile of HILIC enables the chromatography of very polar and often small molecules, which won't show any retention on C₈ or C₁₈ reversed phases.

Ultra-fast separations at moderate back pressure

NUCLEOSHELL® HILIC is a core-shell technology based stationary phase with a covalently bonded 3-*N,N*-dimethylamino-propane sulfonic acid ligand (pat. p nd.). The betaine character of the strong ion-exchanger results in full charge balancing and facilitates fast equilibration times.

Good separation of polar compounds like the physiologically important substances creatine and creatinine can be achieved on NUCLEOSHELL® HILIC as well as on NUCLEODUR® HILIC, 1.8 µm at similar retention, but much lower back pressure.

The following chromatograms show the method transfer from a fully porous 3 µm HILIC phase to 2.7 µm core-shell silica with equal selectivity features.

Run time has been cut down to 1 min. Column back pressure remains modest < 400 bar, while solvent demand is reduced to less than 35 %.

Separation of catecholamines

MN Appl. No. 125440

Columns: 100 x 4 mm NUCLEOSHELL® HILIC, 2.7 µm

MACHEREY-NAGEL Column Protection System

The guard column system for HPLC / UHPLC from MN

- Ideal protection for your analytical main column:
significant increase in column lifetime
- Minimized void volume:
suitable also for ultra fast HPLC (UHPLC)
- Special ferrules:
pressure stability up to 1300 bar (18850 psi)
- Cartridges filled with NUCLEODUR[®], NUCLEOSIL[®] and NUCLEOSHELL[®] HPLC adsorbents.
- Universal screw-on guard column holder system
- Suitable for all analytical HPLC columns with 1/16" fittings

Further information on page 251.

NUCLEOSIL®

Key feature

- NUCLEOSIL® is a family of totally porous spherical silicas. They feature a very pure and uniform SiO₂ structure and have gained wide acceptance as routine chromatographic packings for very different fields of modern chromatography.
- One of the first spherical silicas used in HPLC
- Developed in the early seventies, it became a world-renowned HPLC packing
- Absolutely reliable choice for routine analyses
- Largest variety of modified HPLC silicas available
- pH stability 2–8 (for NUCLEOSIL® 100-5 C₁₈ AB 1–9)
- Due to its particle sizes NUCLEOSIL® finds application in analytical as well as in preparative columns.

Benefits of NUCLEOSIL® silica

- High efficiency due to narrow particle size distribution
- High separation performance due to optimized binding techniques
- High chemical and mechanical stability
- High load capacity and recovery rates
- High reproducibility from lot to lot

Physical properties

NUCLEOSIL® is manufactured with different pore diameters (50, 100, 120, 300, 500, 1000 and 4000 Å) and particle sizes from 3 μm (only NUCLEOSIL® 50, 100 and 120) to 10 μm with very narrow fractionation. All narrow-pore NUCLEOSIL® packings are stable up to 500 bar (7 250 psi), the wide-pore NUCLEOSIL® silicas are stable up to 300 or 400 bar (4 200 or 5 600 psi).

Physical properties of unmodified NUCLEOSIL® materials

Phase	Pore size	Pore volume	Surface (BET)	Density	Pressure stability*
NUCLEOSIL® 50	50 Å	0.8 mL/g	420 m ² /g	0.45 g/mL	500 bar
NUCLEOSIL® 100	100 Å	1 mL/g	350 m ² /g	0.36 g/mL	500 bar
NUCLEOSIL® 120	120 Å	0.65 mL/g	200 m ² /g	0.55 g/mL	500 bar
NUCLEOSIL® 300	300 Å	0.8 mL/g	100 m ² /g	0.45 g/mL	400 bar
NUCLEOSIL® 500	500 Å	0.8 mL/g	35 m ² /g	0.45 g/mL	400 bar
NUCLEOSIL® 1000	1000 Å	0.8 mL/g	25 m ² /g	0.45 g/mL	300 bar
NUCLEOSIL® 4000	4000 Å	0.7 mL/g	10 m ² /g	0.48 g/mL	300 bar

* Maximum packing pressure of NUCLEOSIL® bulk packings

NUCLEOSIL® modifications

- NUCLEOSIL® packings are available as unmodified silica or with numerous chemically bonded phases: RP phases like C₁₈ AB, C₁₈ HD, C₁₈ Nautilus, C₁₈, C₁₈ ec, Protect I, C₈ HD, C₈ ec, C₈, C₄, C₂ and C₆H₅ separate mainly by hydrophobic interactions (van der Waals forces). The less polar the sample molecules, the more they are retained – the more polar the sample, the weaker are the hydrophobic interactions and consequently the retention times are shorter.
- Phases with chemically bonded polar groups such as CN, NH₂, N(CH₃)₂, OH show selective separation properties. Due to the availability of different functional groups it is possible

to vary the chemical characteristics of the surface and consequently the adsorption characteristics of the stationary phase.

- Silica-based ion exchangers (NUCLEOSIL® SA and SB) are stable from pH 2 to 8 and do not swell. Compared to resin-based ion exchangers they offer the advantage of constant permeability, even when the ionic strength and/or pH of the eluent are changed. The separation can be influenced by
 - the type of buffer
 - the ionic strength and
 - the pH value.

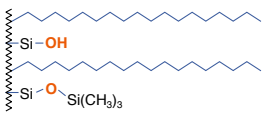

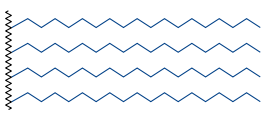

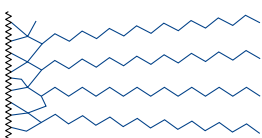

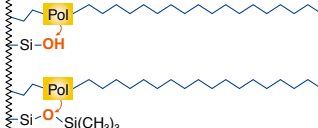

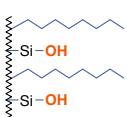

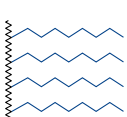

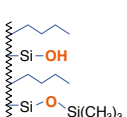

A tabular overview of NUCLEOSIL® phases can be found on page 212.

NUCLEOSIL[®] octadecyl phases (C₁₈) wide pore octadecyl phases · USP L1

Technical data

• Many biologically interesting molecules can not be separated using conventional narrow pore silicas with pore sizes of about 100 Å. This is why MACHEREY-NAGEL offers a complete line of wide pore packings with pore sizes of 300, 500, 1000 and 4000 Å.

• These materials can also be used for size exclusion chromatography (SEC).

All NUCLEOSIL[®] octadecyl phases are endcapped.

Custom-packed columns with different column dimensions are available on request.

NUCLEOSIL® octyl phases (C₈) NUCLEOSIL® standard octyl phases · USP L7

🔧 Technical data

- Nonpolar phases for RP and ion-pairing chromatography
- Endcapped and non-endcapped modifications available; pH stability at 20 °C: 2–8
- Carbon content depending on pore size (see table)

✓ Recommended application

- Separation of moderately to highly polar (water-soluble) compounds: steroids, nucleosides, cyclodextrins, pharmacological plant constituents
- Corresponding NUCLEODUR® phases see C₈ ec page 183

NUCLEOSIL[®] phenyl phases (C₆H₅) · USP L11

Technical data

- Relatively nonpolar, non-encapped phases for RP and ion pairing chromatography
- Polarity similar to C₈, but with different selectivity for PAHs, polar aromatics, fatty acids etc.
- pH stability at 20 °C: 2–8; carbon content 8 %

Recommended application

- Separation of moderately polar compounds

Ordering information

NUCLEOSIL[®] amino phases · USP L8

Technical data

- Aminopropyl modified polar silica phase; pH stability at 20 °C: 2–8; carbon content 3.5 %
- Corresponding NUCLEODUR[®] phases see page 188

Recommended application

Multi-mode chromatography

- NP chromatography with hexane, dichloromethane or 2-propanol as mobile phase for polar compounds such as substituted anilines, esters, chlorinated pesticides
- RP chromatography of polar compounds like carbohydrates in aqueous-organic eluent systems
- Anion exchange chromatography of anions and organic acids using common buffers (e.g., acetate or phosphate) in conjunction with organic modifiers (e.g., acetonitrile)

Ordering information

Eluent in column is *n*-heptane (except for NH₂ RP). When using an eluent which is not miscible with *n*-heptane (e.g., water), it is necessary to rinse the column with THF first.

NUCLEOSIL[®] cyano phases · USP L10

Technical data

- Polar to midpolar cyano (nitrile) modified silica
- pH stability at 20 °C: 2–8; carbon content 5 % for 100 Å pores, ~ 3 % for 120 Å pores
- Corresponding NUCLEODUR[®] phases see page 186

Recommended application

Reversed phase and normal phase chromatography

- Normal phase: with low-polarity solvents for many compounds, which can also be separated on unmodified silica, however, due to the rapid equilibration much more suitable for gradient separations
- Reversed phase: with different selectivity than C₁₈, C₈ or phenyl modified packings

Ordering information

Eluent in column (except for NUCLEOSIL[®] 100-5 CN-RP) is *n*-heptane. When using an eluent which is not miscible with *n*-heptane (e.g., water), it is necessary to rinse the column with THF first.

Analysis of polycyclic aromatic hydrocarbons (PAHs) by HPLC

Polycyclic aromatic hydrocarbons (PAHs) are chemical compounds that consist of fused aromatic rings and do not contain heteroatoms or carry substituents. As a pollutant, they are of concern because some compounds have been identified as carcinogenic, mutagenic, and teratogenic. PAHs are natural components of coal or gas. They are delivered to our environment by pyrolysis (incomplete burning) of organic materials like coal, oil, fuel, wood, tobacco, ... and hence can be found globally. Today most PAHs accrue from anthropogenic processes – but also natural origins (forest fire) are possible. Regarding to past pollutions an important impact had production of coke and gas from black coal. Waste products (e.g., tar) from coking or gas plants are often origin of serious ground water pollutions.

Since a number of PAHs (e.g., benzo[a]pyrene, 3-methylcholanthrene and benzantracene) have been proven to be carcinogenic, control of the PAH content of food, water and soil is an important task for routine analysis. For choice and limiting values of the polycyclics we refer to the governmental regulations, which exist in many countries (e.g., EPA method 610 of the United States Environmental Protection Agency).

PAHs can be determined by different chromatographic techniques (TLC, GC, HPLC). Thus the 6 PAHs according to German drinking water specification (TVO) can, e.g., be analyzed by TLC (see German Standard DIN 38 409), while a much larger number of polycyclic aromatics can be determined by GC or HPLC.

Benzo[a]anthracen

Benzo[a]pyren

HPLC columns for PAH analysis

For PAH analyses we have developed specially modified C₁₈ phases based on NUCLEODUR® and NUCLEOSIL® which allow efficient gradient separation of 16 PAHs according to EPA. Detection of the separated PAHs can be achieved by UV (250–280 nm), with diode array or with fluorescence detection at different wavelengths for excitation and emission. Acenaphthylene cannot be analyzed with fluorescence detection. For cost-effective routine PAH analysis we recommend applications using methanol instead of acetonitrile as eluent. For rapid analysis NUCLEODUR® C₁₈ PAH (3 µm) in short columns (100 mm) provides excellent results at high flow rates. Hereby separation of 16 PAHs according to EPA can be achieved in less than 3 min.

Tightened regulations require determination of 2 additional PAHs (1- and 2-methylnaphthalene) – so we developed highly efficient methods for 18 PAHs on the NUCLEODUR® C₁₈ PAH.

NUCLEOSIL® 100-5 C₁₈ PAH special octadecyl phase for PAH analysis · USP L1

Technical data

- Base material NUCLEOSIL® silica, particle size 5 µm, pore size 100 Å; polymeric coating
- Detection of the separated PAH with UV (250–280 nm), diode array or fluorescence detection at different wavelengths for excitation and emission (acenaphthylene cannot be analyzed with fluorescence detection)

Recommended application

- Efficient gradient separation of the 16 PAHs according to EPA

Separation of the PAH standard according to EPA (REF 722393)

MN Appl. No. 115040

Anion columns for analysis of inorganic anions

NUCLEOGEL® Anion I

Technical data

- Strongly basic polymer-based anion exchanger, particle size 10 µm; pH stability 1–14
- Eluent in column 4 mmol/L salicylate buffer pH 7.8
- Contrary to the silica-based phase also suited for fluoride analysis

NUCLEOSIL® Anion II

Technical data

- Base material NUCLEOSIL® silica, particle size 10 µm, pore size 300 Å strongly basic anion exchanger, exchange capacity 50 µeq/g, pH stability 2–7.5
- Eluent in column 0.15 mol/L (NH₄)₂HPO₄ buffer pH 5.2 recommended buffer concentration for separation of inorganic anions: 2 mmol/L phthalate
- Preferred method of detection: conductivity or negative UV detection

Separation of an anion standard

MN Appl. No. 106440

Column: 250 x 4 mm NUCLEOSIL® Anion II
 Eluent: 2 mmol/L potassium hydrogen phthalate, pH 5.7
 Flow rate: 2 mL/min
 Detection: UV, 280 nm

- Peaks:
1. H₂PO₄⁻
 2. Cl⁻
 3. NO₂⁻
 4. NO₃⁻
 5. SO₄²⁻

NUCLEODEX columns enantiomer separation based on cyclodextrins

NUCLEODEX β -OH β -cyclodextrin (R = H; n = 2) · USP L45

Technical data

- Base material NUCLEOSIL[®] silica, particle size 5 μm , pore size 100 \AA modified cyclodextrins as chiral selectors
- Separation based on hydrogen bonds and dipole interactions between functional groups of the analyte and hydroxyl groups of the cyclodextrin
- Examples for successful enantiomer separations: chlorthalidone and other compounds, which require free hydroxyl groups for enantioselective interactions
- Eluent in column CH_3OH – 0.1 % TEAA pH 4 (55:45)

NUCLEODEX α -PM permethylated α -cyclodextrin (R = CH_3 ; n = 1)

Technical data

- Base material NUCLEOSIL[®] silica, particle size 5 μm , pore size 100 \AA modified cyclodextrins as chiral selectors
- Examples for successful enantiomer separations: mecoprop and dichlorprop as free carboxylic acids, trans-stilbene oxide, styrene oxide
- Eluent in column CH_3OH – 50 mmol/L phosphate pH 3 (70:30)

NUCLEODEX β -PM permethylated β -cyclodextrin (R = CH_3 ; n = 2) · USP L45

Technical data

- Base material NUCLEOSIL[®] silica, particle size 5 μm , pore size 100 \AA modified cyclodextrins as chiral selectors
- Examples for successful enantiomer separations: mephobarbital (prominal), pesticide derivatives mecoprop methyl and dichlorprop methyl
- Eluent in column CH_3OH – 0.1 % TEAA pH 4 (65:35)

NUCLEODEX γ -PM permethylated γ -cyclodextrin (R = CH_3 ; n = 3)

Technical data

- Base material NUCLEOSIL[®] silica, particle size 5 μm , pore size 100 \AA modified cyclodextrins as chiral selectors
- Examples for successful enantiomer separations: steroids or other larger molecules
- Eluent in column CH_3OH – 0.1 % TEAA pH 4 (55:45)

Recommended application

- NUCLEODEX phases are especially suited for the control of optical purity, but also for semipreparative separations and for the analysis of positional and cis-trans isomers.
- For numerous separations on NUCLEODEX phases please visit our website: www.mn-net.com/apps

HPLC columns for enantiomer separations

Separation of the positional isomers of nitroaniline

MN Appl. No. 101420

Column: 200 x 4 mm NUCLEODEX β-OH
 Eluent: methanol – 0.1 % triethylammonium acetate pH 4.0 (50:50, v/v)
 Flow rate: 0.7 mL/min
 Pressure: 180 bar
 Detection: UV, 254 nm
 Injection: 1 μL

- Peaks:
1. *m*-Nitroaniline
 2. *o*-Nitroaniline
 3. *p*-Nitroaniline

Enantiomer separation of styrene oxide

MN Appl. No. 106160

Column: 200 x 4 mm NUCLEODEX α-PM
 Eluent: methanol – 0.1 % triethylammonium acetate pH 4.0 (60:40, v/v)
 Flow rate: 0.7 mL/min
 Pressure: 160 bar
 Detection: UV, 230 nm
 Injection: 2 μL

Enantiomer separation of mephobarbital

MN Appl. No. 105800

Column: 200 x 4 mm NUCLEODEX β-PM
 Eluent: methanol – 0.1 % triethylammonium acetate pH 4.0 (55:45, v/v)

NUCLEOCEL DELTA enantiomer separation based on a cellulose derivative · USP L40

Technical data

- Base material silica, chiral selector cellulose tris-(3,5-dimethylphenylcarbamate)
- High resolution type (S) with 5 µm particle size, allows use of shorter columns (150 mm) for faster separations, pressure stability up to ~150 bar (2000 psi), pH stability 1–9

NUCLEOCEL DELTA for normal phase applications: eluent in column *n*-heptane – 2-propanol (90:10, v/v) typical eluents are heptane – propanol mixtures

NUCLEOCEL DELTA-RP for reversed phase applications: eluent in column acetonitrile – water (40:60, v/v) designed for use either in polar organic mode or with eluents containing high concentrations of chaotropic salts such as perchlorate

Recommended application

- Pharmaceutically active compounds, chiral pollutants (e.g., herbicides, PCB), chiral compounds in food (dyes, preservatives), chiral catalysts and bioorganic compounds

Similar phases: Chiralcel® OD, Kromasil® CelluCoat™, Eurocel® 01, Lux™ Cellulose-1

Enantiomer separation of indapamide

RESOLVOSIL BSA-7 protein phase for enantiomer separation · USP L75

Technical data

- Base material NUCLEOSIL® silica, particle size 7 µm, pore size 300 Å chiral selector bovine serum albumin (BSA)
- Separation based on selective interaction of proteins with low molecular compounds, i.e. principles of bioaffinity, including hydrophobic interactions (similar to a true reversed phase), interactions of polar groups and steric effects

Recommended application

- Amino acid derivatives, aromatic amino acids, aromatic sulfoxides, barbiturates, benzodiazepinones, benzoin and benzoin derivatives, β-blockers, coumarin derivatives, and for monitoring stereoselective microbial and enzymatic conversions

Enantiomer separation of *N*-benzoyl-*D,L*-amino acids

MN Appl. No. 105450

NUCLEOSIL® CHIRAL-1 enantiomer separation based on ligand exchange · USP L32

🔧 Technical data

- Base material NUCLEOSIL® silica, particle size 5 µm, pore size 120 Å chiral selector L-hydroxyproline – Cu²⁺ complexes
- Principal interaction mode:
 - formation of ternary mixed-ligand complexes with Cu(II) ions; differences in the stability of the diastereomeric complexes cause chromatographic separation

✓ Recommended application

- Enantiomers with two polar functional groups with the correct spacing such as α-amino acids, α-hydroxycarboxylic acids (e.g., lactic acid), *N*-alkyl-α-amino acids etc.

D,L-alanine enantiomers

MN Appl. No. 105410

NUCLEOSIL® CHIRAL-2 · CHIRAL-3 enantiomer separation in organic eluent systems · USP L36

Technical data

- Base material NUCLEOSIL® silica, particle size 5 µm, pore size 100 Å chiral selector for NUCLEOSIL® CHIRAL-2 is *N*-(3,5-dinitrobenzoyl)-*D*-phenylglycine, for CHIRAL-3 the optical antipode is used, “brush type” phases
- Principle interaction modes: charge-transfer interactions, hydrogen bonds, dipole-dipole interactions and steric effects

Recommended application

- analysis of stereoisomers such as separation of enantiomers and diastereomers, control of optical purity of plant protectives (pesticides, e.g., propionic acid derived herbicides) pharmaceuticals etc. and for product control in chiral organic syntheses
- For control of optical purity of a substance, the columns NUCLEOSIL® CHIRAL-2 and NUCLEOSIL® CHIRAL-3 allow to select conditions such that the minor enantiomer, present as an impurity, is eluted before the main peak. Overlapping peaks are avoided. This makes an exact quantification of the impurity much easier.

Enantiomer separation of *D,L*-supidimide

MN Appl. No. 105690

Column: 250 x 4 mm NUCLEOSIL® CHIRAL-2
 Eluent: tetrahydrofuran – *n*-heptane (10:3, v/v)
 Flow rate: 1.0 mL/min
 Detection: UV, 220 nm

Control of optical purity of mecoprop methyl

MN Appl. No. 111360

Columns: a) 250 x 4 mm NUCLEOSIL® CHIRAL-2
 b) 250 x 4 mm NUCLEOSIL® CHIRAL-3
 Eluent: *n*-heptane – 2-propanol – TFA (100:0.05:0.05, v/v/v)
 Flow rate: 1 mL/min, ambient temperature
 Detection: UV, 230 nm, Injection 1 µL (sample with 90 % ee)

NUCLEOGEN® columns anion exchange chromatography of nucleic acids

NUCLEOGEN® 60-7 DEAE pore size 60 Å

Technical data

- Base material silica, particle size 7 µm; DEAE anion exchanger
- For the separation of oligonucleotides up to chain lengths of 40 bases with recoveries > 95 % capacity 200 A₂₆₀/mL (~ 300 A₂₆₀ for a 125 x 4 mm ID column, 1875 A₂₆₀ for a 125 x 10 mm ID column)
- Preparative separations possible when using higher flow rates and longer gradient times

NUCLEOGEN® 500-7 DEAE pore size 500 Å

Technical data

- Base material silica, particle size 7 µm; DEAE anion exchanger
- For the separation of tRNA, 5S RNA, viroids and messenger RNA in the intermediate molecular weight range (25–1 000 kDa) with recoveries > 95 %
- Capacity 730 A₂₆₀ for a 125 x 6 mm ID column, 1940 A₂₆₀ for a 125 x 10 mm ID column

NUCLEOGEN® 4000-7 DEAE pore size 4000 Å

Technical data

- Base material silica, particle size 7 µm; DEAE anion exchanger
- For the separation of plasmids, DNA restriction fragments, ribosomal RNA, messenger RNA and viral RNA, i.e. very high molecular weight nucleic acids (e.g., 1–50 MDa)
- Capacity 120 A₂₆₀ for a 125 x 6 mm ID column, 350 A₂₆₀ for a 125 x 10 mm ID column

For more separations of deoxyoligonucleotides, plasmids and DNA restriction fragments visit our website www.mn-net.com/apps

Separation of plasmid pBR 322

MN Appl. No. 107480

M. Colpan, D. Riesner, private communication

A) isolation of plasmid DNA from a crude cell lysate

Sample: 5 µg plasmid pBR 322 containing cleared lysate from *E. coli*

Column: 125 x 6 mm NUCLEOGEN® 4000-7 DEAE

Eluent: A) 20 mmol/L K phosphate buffer pH 6.9; 5 mol/L urea
B) eluent A + 1.5 mol/L KCl
20–100 % B in 50 min;
arrow = ionic strength of 850 mmol/L

Flow rate: 1.0 mL/min, 70 bar, ambient temperature

Detection: UV, 260 nm

B) separation of supercoiled plasmid from relaxed and linear forms

Sample: plasmid pBR 322, supercoiled, relaxed and linear

Column: 125 x 6 mm NUCLEOGEN® 4000-7 DEAE

Eluent: A) 20 mmol/L K phosphate buffer pH 6.8; 6 mol/L urea
B) eluent A + 2 mol/L KCl
42–100 % B in 230 min

Flow rate: 1.5 mL/min, 45 bar, ambient temperature

Separation of oligo(rA)_n

MN Appl. No. 115180

Column: 125 x 4 mm NUCLEOGEN® 60-7 DEAE

Eluent: A) 20 mmol/L phosphate buffer, pH 5.5, 5 mol/L urea
B) buffer A + 1 mol/L KCl
0–100 % B in 200 min

Flow rate: 2 mL/min

Pressure: 110 bar

Temperature: ambient

Detection: UV, 260 nm

Preparative separation of a crude RNA extract of viroid (PSTV) infected tomato plants

MN Appl. No. 107490

D. Riesner, BioEngineering 1 (1988) 42–48

Column: 125 x 6 mm NUCLEOGEN® 500-7 DEAE

Eluent: A) 250 mmol/L KCl, 20 mmol/L phosphate buffer, pH 6.6, 5 mol/L urea
B) 1 mol/L KCl, 20 mmol/L phosphate buffer, pH 6.6, 5 mol/L urea
0–50 % B in 120 min, 50–100 % B in 250 min

Flow rate: 3 mL/min

Pressure: 40 bar, ambient temperature

Detection: 260 nm

NUCLEOGEL® SAX anion exchange of biological macromolecules · USP L23

Technical data

- Polymer-based strongly basic anion exchanger $-N^+(CH_3)_3$, gel matrix quaternized PEI; particle size 8 μm , pore size 1000 \AA
- pH working range 1–13, max. working pressure 200 bar

Recommended application

- Purification of peptides, large proteins and oligonucleotides, high capacity for proteins even at pH 10

NUCLEOGEL® SCX cation exchange of biological macromolecules · USP L22

Technical data

- Polymer-based strongly acidic cation exchanger $-SO_3^-$, hydrophilic gel matrix; particle size 8 μm , pore size 1000 \AA
- pH working range 1–13, max. working pressure 200 bar

Recommended application

- Proteins, peptides and carbohydrates with high isoelectric point

Separation of hen's egg white

MN Appl. No. 115200

Sample: frozen egg white was thawed, filtered and diluted 1:8 with eluent A
 Column: 50 x 4.6 mm NUCLEOGEL® SAX 1000-8
 Eluent: A) 0.01 mol/L Tris-HCl, pH 7.5; B) A + 0.5 mol/L NaAc, pH 7.5; 0–100 % B in 20 min
 Flow rate: 1 mL/min
 Inj. volumen: 50 μL
 Detection: UV, 280 nm

- Peaks:
1. Conalbumin
 2. Ovalbumin
 3. not identified

Separation of protein standards

MN Appl. No. 108261

Column: 50 x 4.6 mm NUCLEOGEL® SCX 1000-8
 Eluent: A) 0.02 mol/L KH_2PO_4 , pH 6.0
 B) A + 0,5 mol/L NaCl, pH 6.0
 0–100 % B in 20 min
 Flow rate: 1 mL/min
 Detection: UV, 280 nm

- Peaks:
1. Myoglobin
 2. α -Chymotrypsinogen A
 3. Cytochrome C
 4. Lysozyme

NUCLEODUR® 300 C₁₈ ec · C₄ ec wide pore silica for biochromatography · USP L1 (C₁₈) · USP L26 (C₄)

★ Key feature

- Reliable wide pore RP phases for daily routine analysis
- Medium density octadecyl or butyl modification with exhaustive endcapping
- Ideal phases for separation of biomolecules

🔧 Technical data

- Pore size 300 Å; particle size 5 µm, carbon content 4 % for C₁₈, 2.5 % for C₄; pH stability 1–9; high reproducibility from lot to lot

✓ Recommended application

- Biological macromolecules like proteins or peptides

Column selection by analyte characteristics

Tanaka plots of NUCLEODUR® wide pore phases

Batch-to-batch reproducibility of NUCLEODUR® 300-5 C₄ ec and NUCLEODUR® 300-5 C₁₈ ec

MN Appl. Nos. 126551 / 126552

Columns: 250 x 4 mm
 Eluent: A) 0.1 % TFA in water
 B) 0.08 % TFA in acetonitrile
 20–60 % B in 15 min
 Flow rate: 1 mL/min
 Temperature: 25 °C
 Detection: UV, 280 nm

Peaks:
 1. Ribonuclease A
 2. Cytochrome C
 3. Lysozyme
 4. BSA
 5. β-Lactoglobulin
 6. β-Lactoglobulin 2

NUCLEOSIL® MPN RP chromatography of biological macromolecules

NUCLEOSIL® 100-5 C₁₈ MPN · USP L1

★ Key feature

- Octadecyl phase, particle size 5 µm; pore size 100 Å
- Dynamic protein binding capacity per g packing: 6 mg BSA, 110 mg cytochrome C
- pH working range 2–8, max. working pressure 250 bar

🔧 Technical data

- Silica-based reversed phase materials with monomerically bonded alkyl chains, brush type structure predominantly hydrophobic forces with a small portion of hydrophilic interactions
- Maximum separation efficiency can be achieved when the injected protein mass does not exceed 1–2 % of the maximum protein loading capacity.

NUCLEOSIL® 300-5 C₄ MPN · USP L26

★ Key feature

- Butyl phase, particle size 5 µm, pore size 300 Å
- Dynamic protein binding capacity per g packing: 14 mg BSA, 27 mg cytochrome C especially suited for the purification of larger, hydrophobic peptides and very different proteins
- pH working range 2–8, max. working pressure 250 bar

🔧 Technical data

- Silica-based reversed phase materials with monomerically bonded alkyl chains, brush type structure predominantly hydrophobic forces with a small portion of hydrophilic interactions
- Maximum separation efficiency can be achieved when the injected protein mass does not exceed 1–2 % of the maximum protein loading capacity.

Separation of haemoglobin chains

MN Appl. No. 108240

Column: 250 x 4 mm NUCLEOSIL® 300-5 C₄ MPN
 Eluent: A) 20 % acetonitrile, 80 % water, 0.1 % TFA
 B) 60 % acetonitrile, 40 % water, 0.1 % TFA
 40–60 % B in 60 min
 Flow rate: 1 mL/min
 Detection: UV, 220 nm

- Peaks:
1. Hem
 2. β-globin
 3. α-globin
 4. ^Δγ^T-globin
 5. ^εγ-globin
 6. ^Δγ^L-globin

NUCLEOSIL® PPN RP chromatography of biological macromolecules

NUCLEOSIL® 100-5 C₁₈ PPN · USP L1

★ Key feature

- Octadecyl phase, particle size 5 µm, pore size 100 Å, dynamic protein binding capacity per g packing: 8 mg BSA, 64 mg cytochrome C; suited for the separation of peptides and proteins up to about 40 kD, also suited for basic peptides

🔧 Technical data

- Silica-based reversed phase materials with polymerically bonded alkyl chains; exclusively hydrophobic interactions
- pH working range 1–9, max. working pressure 250 bar

NUCLEOSIL® 500-5 C₁₈ PPN · USP L1

★ Key feature

- Octadecyl phase, particle size 5 µm, pore size 500 Å, dynamic protein binding capacity per g packing: 22 mg BSA, 40 mg cytochrome C; especially suited for large peptides and medium-size hydrophilic proteins

🔧 Technical data

- Silica-based reversed phase materials with polymerically bonded alkyl chains; exclusively hydrophobic interactions
- pH working range 1–9, max. working pressure 250 bar

Separation of a protein standard

MN Appl. No. 108220

Column: 125 x 4 mm NUCLEOSIL® 100-5 C₁₈ PPN

Eluent: A) 0.1 % TFA in H₂O
B) 0.08 % TFA in CH₃CN
20–60 % B in 10 min

Flow rate: 1.0 mL/min

Detection: UV, 280 nm

Peaks:

1. Ribonuclease
2. Cytochrome C
3. Lysozyme
4. β-Lactoglobulin
5. Ovalbumin

Separation of pancreatic secretion of piglets

MN Appl. No. 108280

Column: 125 x 4 mm NUCLEOSIL® 500-5 C₁₈ PPN

Eluent: A) 0.1 % TFA in H₂O
B) 0.08 % TFA in CH₃CN
30–50 % B in 14 min, then 50–65 % B in 6 min

Flow rate: 1 mL/min

Detection: UV, 215 nm

Peaks:

1. Trypsin + trypsinogen
2. Proelastase
3. Lipase + α-Chymotrypsin
4. Chymotrypsinogen
5. α-Amylase
- 6., 7. Procarboxypeptidase

NUCLEOGEL® RP columns RP columns for biochemical applications · USP L21

Technical data

- Polystyrene resin cross-linked with divinylbenzene, available particle sizes 5 µm and 8 µm, available pore sizes 100 Å and 300 Å
- pH working range 1–13, max. working pressure 180 bar
- Small pore columns for reversed phase separation of small molecules such as pharmaceuticals with basic properties, e.g., organic heterocycles; also suited for separation of nucleosides and nucleotides up to 5000 Da; allow gradient as well as isocratic elution
- Wide pore columns are especially recommended for large biomolecules higher background hydrophobicity compared to silica phases

Analysis of the synthetic acyl carrier protein ACP(65-74)

MN Appl. No. 108500

Column: 150 x 4.6 mm NUCLEOGEL® RP 100-8
 Eluant: A) 0.1 % TFA in acetonitrile – water (1:99, v/v)
 B) 0.1 % TFA in acetonitrile – water (99:1, v/v)

NUCLEOGEL® SUGAR 810 separation of sugars · USP L17 (H-Form) · USP L19 (Ca form)

Technical data

- Sulfonated polystyrene - divinylbenzene resins in different ionic forms; due to a different selectivity pattern compared to NUCLEOGEL® SUGAR columns, the range of application is considerably enlarged
- Separation mechanism: ion exclusion, ion exchange, size exclusion, ligand exchange, NP and RP chromatography

Recommended application

- H⁺ form: Separation of sugars, sugar alcohols and organic acids; eluent in column 5 mmol/L H₂SO₄
- Ca²⁺ form: Separation of mono-, di- and oligosaccharides; eluent in column water

Organic acids and alcohols

MN Appl. No. 113870

Column: 300 x 7.8 mm NUCLEOGEL® SUGAR 810 H
 Eluent: 5 mmol/L H₂SO₄
 Flow rate: 0.6 mL/min
 Temperature: 35 °C
 Detection: RI
 Injection: 5 µL

Sugars and sugar alcohols

MN Appl. No. 114160

HPLC columns for sugar analyses

NUCLEOGEL® ION 300 OA / SUGAR

separation of sugars · USP L17 (H form) · USP L19 (Ca form) · USP L34 (Pb form) · USP L58 (Na form)

Technical data

- Sulfonated spherical PS/DVB resins in different ionic forms; mean particle size 10 µm, pore size 100 Å
- Separation mechanism includes steric exclusion, ligand exchange and partition effects, ligand exchange being the predominant force, since the hydrated metal ions form strong interactions with the hydroxyl groups of the sample molecules. The intensity of these interactions decreases in the sequence Pb > Ca > Na
- Recommended operating temperatures: 60–95 °C; maximum pressure 70 bar

Recommended application

- NUCLEOGEL® ION 300 OA:
H⁺ form for separation of sugars, alcohols and organic acids
- NUCLEOGEL® SUGAR:
Ca²⁺ form: separation of mono- and oligosaccharides, sugar alcohols
- Pb²⁺ form: separation of mono- and disaccharides from food and biological samples
- Na⁺ form: separation of oligosaccharides from starch hydrolysates and food

Separation of carbohydrates

MN Appl. No. 102430

EC standard columns for analytical HPLC / UHPLC

- Analytical column system manufactured from stainless steel M8 outer threads on both ends combination of sealing element and very fine-meshed stainless steel screen, PTFE ring and fitting adaptor column heads SW 12, with inner threads M8 x 0.75 and UNF 10-32 (= 1/16" connection)
- EC column hardware guarantees pressure stability of 1200 bar - hereby EC columns are suitable for UHPLC applications (ultra fast HPLC) and all modern HPLC systems.
- As screw-on guard column system we recommend the Column Protection System used with EC guard column cartridges with 4 mm length.
- EC guard columns supplied with NUCLEODUR[®], NUCLEOSIL[®] spherical silicas and NUCLEOSHELL[®] spherical core shell silica particles

Column Protection System

Innovative and universal guard column holder system

- Suitable for all analytical HPLC columns with 1/16" fittings
- Cartridges filled with special NUCLEODUR®, NUCLEOSIL® and NUCLEOSHELL® HPLC adsorbents
- Ideal protection for your analytical main column → significant increase in column lifetime
- Minimized dead volume → suitable also for ultra-fast HPLC
- Special ferrules → pressure stability up to 1300 bar (18 850 psi)
- Visual contamination check → in-time changing of the guard column
- Suitable guard columns with 4 mm length, 2 mm ID (for main columns with 2 mm ID); 3 mm ID (for main columns with 3, 4 and 4.6 mm), respectively
- UNIVERSAL RP guard columns suitable for all HPLC columns under RP conditions

Visual contamination check

The cartridge is fitted with a special filter membrane:

- If this silver membrane is contaminated (bright or dark discoloration), it is advisable to replace the cartridge.
- If the contaminants are colorless, replace the cartridge if the pressure rises or the chromatographic performance decreases.

VarioPrep (VP) columns for preparative HPLC

- Column system for preparative HPLC, manufactured from stainless steel with two adjustable end fittings, suitable for frequent use of back-flushing techniques
- Allows compensation of a dead volume, which could occur at the column inlet after some time of operation, without need for opening the column
- Can be packed with all NUCLEODUR® and NUCLEOSIL® spherical silicas

Available standard dimensions of VarioPrep columns with axially adjustable end fittings

End fitting design	ID	Length →		Length →						
		10* mm	15* mm	50 mm	75 mm	100 mm	125 mm	150 mm	250 mm	500 mm
	8	+		+		+	+	+	+	
	10			+		+	+	+	+	
	16	+		+		+	+	+	+	
	21			+	+	+	+	+	+	
	32		+			+		+	+	
	40			+		+	+	+	+	+
	50		+			+		+	+	
	80								+	+

* 10 x 8, 10 x 16, 15 x 32 and 15 x 50 mm ID columns are used as guard columns and require the respective holders, see page 253.

The VarioPrep principle

VarioPrep columns are produced with highest packing quality and bed density (1). Due to intensive chemical and/or mechanical exposure of the column adsorbent, shrinking of the column bed can occur (2; orange gap). In this even unlikely case readjustment of the VarioPrep

column fitting (3; turning the nut at the column inlet clockwise) will eliminate the emerged dead volume (4). The performance of the VarioPrep column is completely reconstituted and column lifetime is significantly extended.

Column reconstitution

Reconstitution of VarioPrep column performance

- Slight peak broadening and deformation after 800 injections under strongly demanding conditions (pH 11; 50 °C; sample in DMSO)
- Readjustment of the column fitting restores column performance and prolongs column lifetime noticeably.

The improved guard column system for (semi-) preparative HPLC

- ① VP 15/32 for 32 and 40 mm ID columns
- ② VP 10/16 for 16 and 21 mm ID columns
- ③ VP 10/8 for 8 and 10 mm ID columns
- ④ VP 15/50 for ≥ 50 mm ID columns

- Easy handling and cartridge exchange
- Robust hardware
- Free rotary plunger fittings – low O-ring abrasion
- Cost-efficient cartridges
- Minimally invasive / no disturbance of the separation efficiency of main column
- Low back pressure
- Designed for pressures up to 400 bar

Column performance without and with guard column

Columns: 125 x 16 mm NUCLEODUR® C₁₈ HTec, 5 μ m
 125 x 16 mm NUCLEODUR® C₁₈ HTec, 5 μ m + 10 x 16 mm NUCLEODUR® C₁₈ HTec guard column
 Eluent: acetonitrile – water (80:20, v/v)
 Flow rate: 16 mL/min
 Temperature: 22 °C

- Peaks:
 1. Phenol
 2. Naphthalene
 3. Anthracene

Using VarioPrep guard columns provides ideal protection of your main column – symmetry, pressure and retention stay almost constant.

Technical data

• 1/16" thread • free rotary plunger fittings – low O-ring abrasion • stainless steel

Guard cartridge	Holder REF	Holder ID	Recommended for column ID	Preferred capillary ID	Typical flow rate
VP 10/8	718251	8 mm	8 and 10 mm ID	0.17 and 0.25 mm	1–12 mL/min
VP 10/16	718256	16 mm	16 and 21 mm ID	0.17, 0.25 and 0.5 mm	2–32 mL/min
VP 15/32	718253	32 mm	32 and 40 mm ID	0.25, 0.5 and 1.0 mm	5–150 mL/min
VP 15/50	718255	50 mm	≥ 50 mm ID	0.5 and 1.0 mm	20–250 mL/min

Ordering information

Guard column holders for VarioPrep columns

VP Guard columns for VarioPrep columns with ID →		Pack of guard columns	Replacement O-ring (pack of 2)	Holder ID	REF
8, 10 mm	16, 21 mm				
VP 10/8		2	718975	8 mm	718251
VP 10/16		2	718976	16 mm	718256
VP 15/32		1	718977	32 mm	718253
VP 15/50		1	718978	50 mm	718255

For REF numbers of individual VP guard column cartridges see respective NUCLEODUR® and NUCLEOSIL® phases.

Accessories for stainless steel HPLC columns

- Stainless steel columns are most frequently used in HPLC.
- The material is corrosion resistant, pressure stable and easy to work mechanically.

1/16" ferrule	5	718584
Capillary unions		
Typ 1: 100 mm x 1/16" x 0.25 mm	1	718637
Typ 2: 100 mm x 1/16" x 0.12 mm	1	719489
Cutter for 1/16" capillary tubing	1	706290

For accessories and replacement parts for EC columns see page 251, for accessories and replacement parts for VarioPrep columns see page 253.

SPE accessories for sample preparation, like e.g., CHROMABOND® vacuum manifolds can be found on page 65.

PEEK accessories

• PEEK (= polyether ether ketone) is a high performance polymer belonging to the group of polyarylether ketones (PAEK), which meets all requirements of HPLC columns with respect to chemical resistance and mechanical stability. In some fields of application in HPLC like, e.g., in ion chromatography and chromatography of biopolymers, PEEK fulfils the requirements for a nonmetallic material.

• All fittings can be tightened by hand.

Basics of preparative HPLC

In principal for preparative HPLC the same rules apply than for analytic HPLC. However both differ significantly in their aim. The aim of analytic HPLC is a preferably complete separation of the single components of a mixture with subsequent peak identification. In contrast the goal of preparative HPLC is isolation of the desired product in defined purity, maximum amount while having a cost effective method of operating.

Demand of a preparative separation

- Throughput
- Purity
- Yield

Upscaling table for current MN column dimensions

ID x Length [mm]	4 x 250	8 x 250	10 x 250	16 x 250	21 x 250	32 x 250	40 x 250	50 x 250	80 x 250
Linear scale-up factor	1	4	6.25	16	27.6	64	100	156.3	400
Typical amount of sample* [mg]	0.02–2	0.08–8	0.13–13	0.3–35	0.6–60	1.3–130	2–210	3–350	10–850
Typical flow rate [mL/min]	0.5–1.5	2–6	3–9	8–24	14–40	32–96	50–150	80–250	200–600

* based on RP material; the herein stated maximum amounts of sample are dependent on the separation problem and the sample. In some cases half the maximum amount of sample can already lead to a drastic overload of the column, in other cases the maximum amount of sample still leads to an acceptable separation.

NUCLEODUR[®] bulk packings

- Fully spherical high purity silica
- Pore size 110 Å; pore volume 0.9 mL/g; surface (BET) 340 m²/g; density 0.47 g/mL; pressure stable up to 600 bar
- Bigger particles for preparative application

Silica adsorbents for low pressure column chromatography

- Silica 60; pore size ~ 60 Å; pore volume ~ 0.75 mL/g; spec. surface BET ~ 500 m²/g highly porous, amorphous silicic acid in the form of hard, opalescent particles, prepared by precipitation of water glass with sulfuric acid
- For higher demands on the performance of column packings we recommend our high-purity irregular POLYGOPREP silicas (see before).
- Silica FIA for the fluorescence indicator adsorption procedure for the determination of hydrocarbon groups in the testing of liquid fuels in accordance with DIN 51791 and ASTM D 1319-58T
- The FIA method determines saturated hydrocarbons, olefins and aromatic hydrocarbons of a sample chromatographically by adsorption and desorption in a column filled with FIA silica, in the presence of a fluorescent dye mixture.

Kieselguhr

- Naturally occurring amorphous silicic acids of fossil origin, also known as diatomaceous earth or diatomite purified for chromatographic applications
- Compared to silica, kieselguhr has a small surface of low activity → application in partition chromatography; impregnated with various substances (paraffin, silicone oil, undecane) it can be used for reversed phase chromatography
- The following grades of kieselguhr are manufactured by Johns-Manville. They are narrowly classified with homogeneous particle size distributions and high purity.
- For columns packed with kieselguhr please see CHROMABOND® XTR for liquid-liquid extraction, page 63.

MACHEREY-NAGEL

optimal autosampler vials for your sample

Vials and closures

For reliable and reproducible analysis the correct storage of sample solutions is important. MACHEREY-NAGEL offers diverse vials and suitable closures.

Our product range includes

- Different vial types from N 8 to N 24
 - Crimp neck
 - Screw neck
 - Snap ring
- Clear glass, amber glass and polypropylene vials, with or without scale and label
- Diverse inserts for small sample volumes
- Variety of closures and septa of different material
- Suitable accessories like crimping tools and vial containers
- Compatibility with different autosamplers from page 136 onwards

Our broad range of vials and closures can be found from page 97 onwards.

Also use our VialFinder on www.mn-net.com/VialFinder

Glass plates

ALUGRAM® Xtra aluminum sheets
ALUGRAM® aluminum sheets

POLYGRAM® polyester sheets

Thin layer chromatography (TLC) and high performance thin layer chromatography (HPTLC), also called planar chromatography, are, like all chromatographic techniques, based on a multi-stage distribution process involving

- Suitable adsorbents (the stationary phase) coated as a thin layer onto a suitable support (e.g., glass plate, polyester or aluminum sheet; also see page 272)
- Solvents or solvent mixtures (the mobile phase or eluent)
- Sample molecules

The principle of TLC is known for more than 100 years [11]. The real break-through as an analytical method, however, came about 50 years ago as a consequence of the pioneering work of Egon Stahl [12].

Today TLC has gained increasing importance as an analytical separation technique, which is probably due to effects of instrumentation and automation [13]. At the same time the applicability of thin layer chromatography was enhanced by development of new adsorbents and supports.

Today MACHEREY-NAGEL offers a versatile range of ready-to-use layers, which are the result of 50 years of continuous research and development.

Features of modern TLC / HPTLC

The success of thin layer chromatography as a highly efficient microanalytical separation method is based on a large number of advantageous properties:

- High sample throughput in a short time
- Suitable for screening tests
- Pilot procedure for HPLC and Flash chromatography
- After separation the analytical information can be stored for a longer period of time (the TLC ready-to-use layer acts as storage medium for data)
- Separated substances can be subjected to subsequent analytical procedures (e.g., IR, MS) at a later date
- Rapid and cost-efficient optimization of the separation due to easy change of mobile and stationary phase

Principle steps of a TLC separation

Sample preparation

For separation the sample must meet several requirements to obtain good results. Since the TLC plate is a disposable product, sample preparation in general is not as demanding as for other chromatographic methods. However, eventually several steps for sample pretreatment may be necessary. These include sampling, mechanical crushing, extraction steps, filtration and sometimes enrichment of interesting components or clean-up, i.e. removal of undesired impurities.

Our TLC micro-sets introduce some simple methods of sample pretreatment. The dyes or dye mixtures of the beginner's set do not require complicated procedures. The advanced sets require

the user to carry out some additional steps for preparing a sample, thus introducing the user to techniques often performed in industrial laboratories.

Thorough preparation of samples is an important prerequisite for the success of a TLC separation. For our range of products for more demanding sample pretreatment please see the chapter "SPE" from page 10.

Sample application

The most frequent technique is application with a glass capillary as spot or short streak.

Application as streak will yield better results especially for instrumental quantification. For both types of application some manual skill is required to obtain reproducible results. Substance zones which are too large from the beginning will cause poor separation since during chromatography they will become even larger and more diffuse.

A valuable aid for manual application especially of large volumes of very dilute samples is the concentrating zone (e.g., SILGUR-25 UV₂₅₄), which consists of a chromatographically inactive adsorbent (kieselguhr). The substances to be separated are concentrated to a small band in the concentrating zone and the separation starts at the beginning of the chromatographically active adsorbent silica.

Another method for sample concentration is a short pre-elution (few mm) with a solvent, in which all substances have a high R_f value.

If a quantitative evaluation with a TLC scanner is to follow the separation we recommend to use commercially available sample applicators for spotting. These range from simple spotting guides via nanoapplicators to completely automated spotting devices. Application as streak can be performed automatically by spraying of the sample without touching the layer of the TLC plate. Application as band over the whole width of the TLC plate is especially important for preparative TLC. After application allow the solvent of the samples to evaporate completely (about 10 min) or blow with cold or hot air. Development of a chromatogram should never start before the solvent of the applied samples is evaporated completely.

Developing a chromatogram – separation techniques

The most frequently used separation technique is ascending TLC in a trough chamber (standard method, linear development). Usually it is applied as single development. However, multiple development, with or without change of eluent (step technique) can improve separation results. For 2-dimensional development only 1 spot of the sample is applied in one edge of a plate. After chromatography in the first direction the plate is dried, turned by 90° and developed in the 2nd dimension with another eluent. Thus complicated mixtures give 2-dimensional chromatograms taking advantage of the different separating properties of two eluents.

For selection and optimization of the eluent numerous publications are available. A generally applicable standardized optimization method is described by H. Keuker et al. [14].

It is important to pay attention to the atmosphere in the developing chamber. If reproducible migration distances are required, saturation of the chamber atmosphere with eluent vapor is necessary. For this purpose the developing chamber is lined with well absorbing chromatography paper (e.g., MN 260) and charged with a correspondingly larger volume of eluent.

Evaluation of a thin layer chromatogram

Evaluation depends on the purpose of the chromatographic analysis. For qualitative determination often localization of substances is sufficient. This can be easily achieved by parallel runs with reference substances.

A parameter often used for qualitative evaluation is the R_f value (retention factor) or the 100-fold value hR_f . The R_f value is defined as follows:

$$R_f = \frac{\text{distance starting line} - \text{middle of spot}}{\text{distance starting line} - \text{solvent front}} = \frac{b}{a}$$

i.e. the R_f values are between 0 and 1, best between 0.1 and 0.8 (i.e. 10–80 for hR_f). If reproducible R_f values are to be obtained, it is essential that several parameters such as chamber saturation, composition of solvent mixtures, temperature etc. are strictly controlled.

Quantitative evaluation is possible by suitable calibration measurements. For this purpose either the area of a substance spot is measured or a photometric evaluation is performed directly on the layer. The latter procedure, however, requires a higher instrumental expense.

The following paragraphs describe the most frequently used methods for evaluation in TLC.

Qualitative detection

Qualitative evaluation is generally made directly on the TLC plate via characteristic R_f values of substances, i.e. the ratio of distance start – substance zone to distance start – solvent front and specific chemical reactions.

Visualization of separated substances

First of all it is necessary to recognize the position of a substance spot. Only in very few cases the sample is a dye which can be seen with the naked eye. Much more often for unspecific visualization substances can be viewed under UV light, since many substances show a UV absorption. If a fluorescent indicator is added to the layer, all substances absorbing in the respective region of wave length cause a quenching of the fluorescence, i.e. they appear as dark spots on the fluorescent layer. Customary fluorescent indicators are excited at 254 nm or (less frequently) at 366 nm with a mercury lamp. For our program of fluorescent indicators for TLC please see page 296.

Quenching of the fluorescence

Identification of separated substances is possible via the R_f value compared to the pure compound, which is often applied simultaneously on the same plate.

For a number of compounds their native fluorescence can be used for visualization, which is excited by UV light (mostly long-wave UV) (e.g., aflatoxins). This allows not only determination of the R_f value, but often enables a further qualitative assignment.

If these methods do not allow localization or characterization of a substance, post-chromatographic detection methods can be applied, chemical reactions on the TLC plate [15]. Quite un-specific reactions are iodine adsorption and the charring technique (spraying with sulfuric acid and heat treatment).

More reliable results are possible with specific reagents for spraying or dipping, which form colored or fluorescent compounds with the substances to be detected. Depending on the sensitivity of these reactions they are not only used for group or substance specific characterization (in addition to the R_f value) but also for quantification down to trace levels. As example take the ninhydrin reaction. Formation of a (usually red) zone with this detection method yields the information, that a certain group of substances, e.g., α -amino acids, are present. The R_f value allows further assignment to one or several single compounds.

For identification of a substance a combination of different detection methods can be useful. Thus almost all lipids can be converted to products with light green fluorescence by reaction with 2',7'-dichlorofluorescein. Adsorption of iodine vapor enables a differentiation between saturated and unsaturated lipids or lipids containing nitrogen. And finally the R_f value is a third means of identification.

Here are some general remarks concerning spraying: use all spray reagents under a fume hood. The developed, dried TLC plate or sheet is placed on a sheet of filter paper for spraying. Usually it is sufficient to fill the sprayer with about 5–10 mL solution. Spray from a distance of about 15 cm with the aid of a rubber ball or – if available – with pressurized air. It is always better to spray a layer twice very thinly and evenly (with intermediate drying), than to saturate the layer with excessive spray reagent. In the latter case spots tend to become diffuse. After visualization mark outlines of zones with a lead pencil, because some spots tend to fade after a while.

Especially for quantitative evaluation short dipping of the layer in the respective reagent solution is recommended. For this purpose automatic instruments are commercially available, which allow reproducible dipping.

When a substance is localized on the TLC plate (e.g., under UV), but not yet identified, TLC scanners allow recording of UV spectra of individual substance zones directly on the layer, or the zone is removed by scratching or cutting (for sheets), eluted and further analyzed, e.g., by FT-IR, RAMAN, NMR or mass spectroscopy.

Quantitative evaluation

Often TLC is considered to be only a semiquantitative analytical procedure. This is true for visual evaluation of spots, since the eye can only compare but not measure absolute values. If, however, a direct optical evaluation (“in situ” measurement) is performed on the TLC plate with a thin layer scanner, after measurement of calibration functions, exact quantitative results are possible. Commercial scanners offer many features such as evaluation in absorption and fluorescence, unattended programmed scanning of lanes, multi-wave length measurement, background correction, selectable base line for integration, recording of spectra,

evaluation of circular or anti-circular chromatograms with very high ease of operation. In addition to manual operation control by a computer is possible with respective data collection and storage. Usually wavelengths from 200 to 700 nm are available (visible and UV), e.g., all post-chromatographic (and of course all pre-chromatographic) visualization procedures are evaluated with the proper wavelength, which is determined with the instrument. Time requirements for all these possibilities are extremely low. Interlaboratory experiments with standard deviations of 2 % show how excellent results are obtainable [16].

TLC micro-sets introductory kits for science education

Beginner's set

- Features separations with simple developing solvents; samples are colored thus eliminating the need for visualization.
- All equipment needed is contained in the set.

Advanced sets F1, F2 and F3

- Require some experience and skill from the user: some of the samples have to be pretreated before separation, and for identification of substances spray reagents have to be used

TLC micro-set A for beginners

This kit contains all chemicals and accessories for the following separations:

- Separation of the fat-soluble (lipophilic)
Test dye mixture 1: butter yellow, indophenol, sudan blue II, sudan red G
- Separation of a mixture of anthraquinone dyes
Test dye mixture 2: blue 1, blue 3, green, green blue, red, violet 1, violet 2
- Separation of a mixture of food dyes
Test dye mixture 3: brilliant black BN (E151), fast red E, erythrosine (E127), yellow orange S (sunset yellow CFC, E110), naphthol red S, ponceau 4 R (E124), tartrazine (E102)
- Separation of dyes from felt tip pens

Contents of TLC micro-set A for beginners

- 1 manual
- 3 developing chambers
- 50 glass capillaries 1 μ L
- 1 spotting guide
- 2 felt tip pens
- 1 measuring cylinder 10 mL
- 50 polyester sheets 4 x 8 cm each of POLYGRAM®: SIL G/UV₂₅₄, Alox N/UV₂₅₄ and CEL 300
- 8 mL each of test dye mixture 1 (4 lipophilic dyes), test dyes sudan red G, and sudan blue II
- 8 mL each of test dye mixture 2 (7 anthraquinone dyes), test dyes blue 1 and violet 2
- 8 mL each of test dye mixture 3 (7 food dyes), test dyes yellow orange S, and brilliant black BN
- 100 mL each of toluene, toluene – cyclohexane (2:1, v/v), ethanol, 2.5 % sodium citrate solution, 25 % ammonia solution – 2-propanol (5:3, v/v)

Ordering information

Designation	Pack of	REF
TLC micro-set A for beginners*	1 kit	814000
Replacement parts for TLC micro-set A		
Test dye mixture 1*, solution of 4 lipophilic dyes in toluene (components see above)	8 mL	814001
Test dye mixture 2*, solution of 7 anthraquinone dyes in toluene – cyclohexane (2:1, v/v) (components see above)	8 mL	814002

Collection of 7 individual components of test dye mixture 2*	7 x 8 mL	814012
Collection of 7 individual components of test dye mixture 3	7 x 8 mL	814013
Sodium citrate, 2.5 g in 100 mL bottle to fill up with distilled water	2.5 g	814029

* These products contain harmful substances which must be specially labeled as hazardous. For detailed information please see SDS.

Information about the advanced sets F1, F2 and F3 can be found on page 270 and page 271.

TLC micro-set F1

This kit contains all chemicals required for the separation of

- Amino acids (test mixture, consisting of alanine, arginine, tryptophan and valine)
- Amino acids in urine
- The heavy metal cations copper(II) and manganese(II)

Contents of TLC micro-set F1

1 manual, 50 glass capillaries 1 μ L
50 polyester sheets 4 x 8 cm each of POLYGRAM®:
SIL G/UV₂₅₄ and CEL 300
100 mL each of *n*-butanol, ninhydrin spray reagent (0.2 % in ethanol), acetone, 25 % ammonia solution, rubeanic acid spray reagent
50 mL each of 50 % acetic acid, 18 % hydrochloric acid
8 mL each of the amino acid test mixture (see left), tryptophan and arginine reference solutions
8 mL each of the heavy metal cation test mixture (see left), Cu²⁺ and Mn²⁺ reference solutions

TLC micro-set F2

This kit contains all chemicals required

- For analysis of edible fats
- For analysis of fats and cholesterol in blood

Contents of TLC micro-set F2

1 manual, 50 glass capillaries 1 μ L
50 polyester sheets 4 x 8 cm POLYGRAM®:
SIL G/UV₂₅₄
5 disposable pipettes 25 μ L
5 sample vials N 11 (1.5 mL) with PE caps and seals
3 sample vials 30 mL (for butter, margarine and edible oil)
100 mL each of cyclohexane and molybdato-phosphoric acid spray reagent
2 x 50 mL acetone with calibrated pipette
25 mL butan-2-one
8 mL cholesterol reference solution

TLC micro-set F3

This kit contains all chemicals required

- For separation of analgetics (pain relievers)
- For drug analysis as shown for cinchona bark

Contents of TLC micro-set F3

1 manual, 50 glass capillaries 1 μ L
50 polyester sheets 4 x 8 cm POLYGRAM®:
SIL G/UV₂₅₄
5 Aspirin® tablets, 5 Thomapyrin® tablets
20 folded filters MN 615 1/4, 11 cm diameter
3 sample vials 8 mL (for Aspirin® sample, Thomapyrin® sample, cinchona bark extract), 5 g cinchona bark
100 mL each of ethanol, 2-propanol, toluene – diethyl ether
je 100 mL Ethanol, 2-Propanol, Toluol – Diethylether (61:39, v/v), spray reagent for caffeine and spray reagent according to Dragendorff-Munier
50 mL each of iron(III) chloride solution and potassium hexacyanoferrate(III) solution, 30 mL ethyl acetate
25 mL each of 12.5 % ammonia solution and diethylamine
8 mL each of caffeine, paracetamol, quinine reference solutions

All experiments with TLC micro-sets F1–F3 require the materials kit (see TLC micro-set M on page 271).

TLC micro-set M

This kit is prerequisite for the separations with kits F1 to F3. In addition, it serves as basic equipment for the individual study of further thin layer chromatographic experiments.

Contents of TLC micro-set M (materials kit)

- 2 x 50 glass capillaries 1 µL, 2 spotting guides
- 1 rubber cap for capillaries
- 1 measuring cylinder 10 mL
- 1 beaker 25 mL
- 2 developing chambers
- 1 glass laboratory sprayer with rubber bulb
- 1 plastic syringe 1 mL
- 20 sheets filter paper MN 713 (15 x 21 cm)
- 50 polyester sheets 4 x 8 cm each of POLYGRAM®: SIL G/UV₂₅₄, Alox N/UV₂₅₄ and CEL 300

Advantages of MN plates and sheets for TLC

Continuous high quality

- Guaranteed by stringent production control including standardized lot tests, surface checks for roughness or cracks as well as hardness and adherence checks

Comprehensive range of phases for TLC / HPTLC

- There is no universal TLC plate which meets all possible types of analyses
- Our versatile range of TLC ready-to-use layers covers many different types of applications

Immediately ready for chromatographic separation

- Coatings or impregnations are not necessary

Homogeneous, smooth, well adhering layers

- An important criterion especially for reproducible quantitative evaluation

Electron microscope photograph of a cross section through a glass plate with silica layer (magnification x 500)

Adsorbents for MN plates and sheets for TLC

Classical adsorbents

- For ~ 80 % of all TLC separations silica 60 (mean pore diameter 60 Å = 6 nm) is used
- Other classical adsorbents are aluminum oxide, cellulose, kieselguhr, ion exchangers and polyamide

Special phases

- Modified silica, like C₁₈ (octadecyl-) cyano-, amino-, diol-, RP-2
- Special layers for specific separations, like PAH- or enantiomer separation

Particle size distribution and thickness of layer

- Are chosen to fit the given type of application (e.g., HPTLC, standard or preparative separations)
- Most MN ready-to-use layers are available with or without fluorescent indicator

Material	glass	polyester	aluminum
Thickness (approx.)	1.3 mm	0.2 mm	0.15 mm
Weight, packaging and storage requirements	high	low	low
Torsional strength	ideal	low	relatively high
Temperature stability	high	max. 185 °C	high
Susceptible to breakage	yes	no	no
Can be cut with scissors	no	yes	yes
Chemical resistance of support materials			
Against solvents	high	high	high
Against mineral acids and conc. ammonia	high	high	low
Stability of the binder system of NP plates in water			
Suitability for aqueous detection reagents	depending on phase	very suitable	ALUGRAM®: limited suitability; ALUGRAM® Xtra: very suitable

Summary of MN ready-to-use layers

Summary				
Phase	Support*	Layer		Page
Standard silica particle size 5–17 µm				
ADAMANT	G	silica 60, improved binder system, optimized particle size distribution		274
SIL G	G P A Ax	silica 60, standard grade		276
DURASIL	G	silica 60, special binder system		277
SILGUR	G Ax	silica 60 with kieselguhr concentrating zone		279
Unmodified silica for HPTLC particle size 2–10 µm				
Nano-SILGUR	G Ax	nano silica 60 with kieselguhr concentrating zone		279
Nano-ADAMANT	G	nano silica 60, improved binder system, optimized particle size distribution		281
Nano-SIL	G A Ax	nano silica 60, standard grade		281
Nano-DURASIL	G	nano silica 60, special binder system		282
Modified silica for HPTLC particle size 2–10 µm				
Nano-SIL C18-50/ Nano-SIL C18-100	G	nano silica with partial or complete C ₁₈ modification		283
RP-18 W/UV ₂₅₄	G A	nano silica with partial octadecyl modification, wettable with water		284
RP-2/UV ₂₅₄	G A	silanized silica = dimethyl-modified nano silica 60		284
Nano-SIL CN	G A	cyano-modified nano silica		285
Nano-SIL NH ₂	G A	amino-modified nano silica		286
Nano-SIL DIOL	G	diol-modified nano silica		287
Aluminum oxide				
Alox-25 / Alox N	G P A	aluminum oxide		288
Cellulose, unmodified and modified				
CEL 300	G P A	native fibrous cellulose MN 300		289
CEL 400	G P	microcrystalline cellulose MN 400 (AVICEL®)		289
CEL 300 PEI	P	polyethyleneimine-impregnated cellulose ion exchanger		290
CEL 300 AC	P	acetylated cellulose MN 300		290
POLYAMID-6				
POLYAMID-6	P	perlon = ε-polycaprolactame		290
Layers for special separations				
CHIRALPLATE	G	RP silica with Cu ²⁺ ions and chiral reagent, for enantiomer separation of amino acids		291
SIL N-HR	P	high purity silica 60, special binder system, higher gypsum content		291
SIL G-25 HR	G	high purity silica 60 with gypsum, recommended for aflatoxin analysis		292
SIL G-25 Tenside	G	silica G with ammonium sulfate for separation of surfactants		292
Nano-SIL PAH	G	nano silica with special impregnation for PAH analysis		292
IONEX-25 SA-Na	P	mixed layer of strongly acidic cation exchanger and silica		293
IONEX-25 SB-AC	P	mixed layer of strongly basic anion exchanger and silica		293
Alox / CEL-AC-Mix	G	mixed layer of aluminum oxide and acetylated cellulose		293
SILCEL-Mix	G	mixed layer of cellulose and silica		293

* G = Glass plates P = POLYGRAM® polyester sheets A = ALUGRAM® aluminum sheets Ax = ALUGRAM® Xtra aluminum sheets

ADAMANT ^G unmodified standard silica layers

★ Key features

- Outstanding hardness and abrasion resistance due to an optimized binder system
- Increased separation efficiency due to an optimized particle size distribution
- High suitability for trace analysis resulting from a UV indicator with increased brilliance and a lownoise background of the layer

🔧 Technical characteristics

- Silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, particle size 5–17 µm

Separation of steroids

MN Appl. No. 402930

Layers: ADAMANT UV₂₅₄, SIL G/UV₂₅₄
 Sample: 0.1 % solution in CHCl₃
 Eluent: chloroform – methanol (97:3, v/v)
 Migration distance: ADAMANT 50 mm in 10 min, SIL G 57 mm in 10 min
 Detection: UV

Substance	R _f ADAMANT	R _f SIL G
Cortisone	0.37	0.27
Corticosterone	0.43	0.30
Testosterone	0.50	0.39
Deoxycorticosterone	0.55	0.46
Progesterone	0.73	0.62

Separation of barbiturates

MN Appl. No. 402950

Layer: ADAMANT UV₂₅₄
 Sample volume: 1 µL
 Eluent: chloroform – acetone (95:5, v/v)
 Migration distance: 70 mm in 20 min
 Detection: UV

Substance	R _f
Thiamylal (0.5 %)	0.69
Thiopental (1.0 %)	0.65
Hexobarbital (5.0 %)	0.41
Pentobarbital (1.0 %)	0.26
Phenobarbital (1.0 %)	0.18

ALUGRAM® Xtra SIL G Ax unmodified standard silica layers on aluminum

★ Key features

- Outstanding wettability for precise colorization results, even with 100 % aqueous detection reagents
- Excellent separation efficiency and reproducibility from lot to lot
- Easy and reliable cutting due to an optimized binder system, no flaking of silica

🔧 Technical characteristics

- Silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, particle size 5–17 µm
- Binder: highly polymeric product, which is stable in almost all organic solvents and resistant towards aggressive visualization reagents, also completely stable in purely aqueous eluents

Separation of nutmeg ingredients

MN Appl. No. 403590

Layer: ALUGRAM® Xtra SIL G UV₂₅₄
 Sample: shake 1.0 g freshly powdered drug for 3 min with 4 mL methanol and filter; apply 10 µL
 Eluent: toluene – ethyl acetate (95:5, v/v)
 Migration distance: 15 cm
 Detection: 254 nm: underivatized
 daylight and 366 nm: spray with 5 % ethanolic sulfuric acid, 1 % vanillic acid and heat to 105 °C

The chromatograms show the following zones with increasing R_f values: linalool (bluish grey), eugenol (yellowish brown), myristicin (reddish brown), and anethole (pink-violet). Other colored zones may appear.

Unmodified TLC silica layers

SIL G G P A unmodified standard silica layers

Technical characteristics

- Silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, particle size 5–17 µm
- Thickness of layer for analytical plates 0.25 mm, for preparative plates 0.5 and 1 mm; for 2 mm preparative layers a slightly coarser material is used
- Indicators: manganese activated zinc silicate with green fluorescence for short-wave UV (254 nm); special inorganic fluorescent pigment with blue fluorescence for long-wave UV (366 nm)
- Binders: highly polymeric products, which are stable in almost all organic solvents and resistant towards aggressive visualization reagents; binder system for POLYGRAM® sheets is also completely stable in purely aqueous eluents

The most TLC layers are available as glass plate, polyester- or aluminum sheet (also see page 272 and 273).

MN TLC pre-coated layers – qualitative and individual tailored

Kieselguhr zone

- For rapid sample application
- Because kieselguhr is completely inert towards a large number of compounds, the samples always form a narrow band at the interface of the two adsorbents, irrespective of shape, size or position of the spots in the concentrating zone. Separation then takes place in the silica layer.

Silica layers with concentrating zone

SILGUR ^G ^{Ax} unmodified standard silica layers with concentrating zone

Technical characteristics

- Silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, particle size 5–17 µm
- Kieselguhr zone for rapid sample application (see page 278)
- Channel-plate with 19 channels help to prevent cross contamination by separating several samples
- More samples can be separated on a plate, and spot areas can be more easily determined

Sharper separation by nano silica

Nano silica for HPTLC

- Narrow fractionation of the silica particles allows theoretical plate heights, which are one order of magnitude smaller than on standard silica layers.

Advantages

- Shorter migration distances
- Lower amount of samples required
- Increased detection sensitivity with equal selectivity
- Less developing time

Nano silica

Standard silica

Comparison of ADAMANT and Nano-ADAMANT plates for separation of anthraquinone dyes

Layers: A) ADAMANT
B) Nano-ADAMANT
Sample: 1 μ L, about 0.1 %
Eluent: toluene – cyclohexane (4:3, v/v)
Migration time: A) 30 min, B) 15 min

Peaks:
1. Blue 3
2. Violet 2
3. Red
4. Green
5. Blue 1
6. Greenish blue
7. Violet 1

Nano-SIL C18 ^G octadecyl-modified HPTLC silica layers

Technical characteristics

- Nano silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, pH stability 2–10, particle size 2–10 µm
- Indicator: acid-resistant product with a pale blue fluorescence for short-wave UV (254 nm), UV-absorbing substances appear as dark-blue to black spots on a light-blue background

Modification

- Partial (50 %) or complete (100 %) octadecyl modification, carbon content 7.5 and 14 %, respectively
- Order of polarity: silica > DIOL > NH₂ > CN > RP-2 > C18-50 > RP-18 W > C18-100

Recommended application

- Reversed phase separation mode with eluents from anhydrous solvents to mixtures with high concentrations of water (see table and figure below)
- Alkaloids, amino acids, preservatives, optical brighteners, barbiturates, polycyclic aromatic hydrocarbons (PAH), drugs, peptides, flavonoids, phenols, indole derivatives, steroids

Modified silica layers

RP-18 W/UV₂₅₄ G A octadecyl-modified HPTLC silica layers

🔧 Technical characteristics

- Nano silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, particle size 2–10 µm, for preparative plates (1 mm thickness of layer) standard silica 60, pH stability 2–10, particle size 5–17 µm
- Indicator: acid-resistant product with a pale blue fluorescence for short-wave UV (254 nm), UV-absorbing substances appear as dark-blue to black spots on a light-blue background

🔧 Modification

- Partial octadecyl (C₁₈) modification, wettable with water, carbon content 14 %
- Order of polarity: silica > DIOL > NH₂ > CN > RP-2 > C18-50 > RP-18 W > C18-100

✅ Recommended application

- NP or RP separation with eluents from anhydrous solvents to mixtures with high concentrations of water (see table and figure on previous page), relative polarity of the eluent determines the polarity of the layer
- Aminophenols, barbiturates, preservatives, nucleobases, polycyclic aromatic hydrocarbons, steroids, tetracyclines, plasticizers (phthalates)

Technical characteristics

- Nano silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, pH stability 2–8, particle size 2–10 µm
- Indicator: acid-resistant product with a pale blue fluorescence for short-wave UV (254 nm), UV-absorbing substances appear as dark-blue to black spots on a light-blue background

Modification

- Cyanopropyl modification, carbon content 5.5 %
- Order of polarity: silica > DIOL > NH₂ > CN > RP-2 > C18-50 > RP-18 W > C18-100

Recommended application

- NP or RP separation modes depending on the polarity of the developing solvent (see figure below)
- Steroid hormones, phenols, preservatives

R_f values of different steroids as a function of eluent composition

Layer: Nano-SIL CN/UV

Polarity of the eluent governs the type of separation mechanism:

Eluent system petroleum ether (PE) – acetone (NP mode)

the higher the concentration of PE, the stronger are the adsorptive interactions of the steroids with the stationary phase

Eluent system acetone – water (RP mode)

the sequence of elution of the steroids is reversed, the most nonpolar compounds are most strongly retained

Separation of preservatives

MN Appl. No. 401440

Layer: Nano-SIL CN/UV
 Sample volume: 400 nL
 Eluent: ethanol – water – glacial acetic acid (20:80:0.2) with 0.1 mol/L tetraethylammonium chloride
 Migration distance: 73 mm in 30 min
 Detection: TLC scanner, UV 254 nm

Peaks:

1. Propyl p-hydroxybenzoate
2. Ethyl p-hydroxybenzoate
3. Methyl p-hydroxybenzoate
4. Benzoic acid
5. Sorbic acid

Nano-SIL NH₂ G A amino-modified HPTLC silica layers

Technical characteristics

- Nano silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, pH stability 2–8, particle size 2–10 µm
- Indicator: acid-resistant product with a pale blue fluorescence for short-wave UV (254 nm), UV-absorbing substances appear as dark-blue to black spots on a light-blue background

Modification

- Aminopropyl modification, carbon content 3.5 %
- Order of polarity: silica > DIOL > NH₂ > CN > RP-2 > C18-50 > RP-18 W > C18-100
- Layer can be wetted equally well with pure water as with organic solvents

Recommended application

- Vitamins, sugars, steroids, purine derivatives, xanthenes, phenols, nucleotides and pesticides

Influence of eluent composition on the separation of nucleotides

Layer: Nano-SIL NH₂/UV
 Eluent: MeOH – H₂O according to fig. + 0.18 mol/L NaCl
 Migration distance: 7 cm

c-AMP, AMP: adenosine monophosphate
 ADP: adenosine diphosphate
 ATP: adenosine triphosphate

Separation of sugars

MN Appl. No. 401590

Layer: Nano-SIL NH₂/UV
 Sample volume: 0.5 µL
 Eluent: ethyl acetate – pyridine – water – glacial acetic acid (60:30:10:5, v/v/v/v)
 Migration distance: 80 mm in 45 min, double development
 Detection: dry layer at 160 °C for 5 min, TLC scanner, UV 254 nm

Peaks (0.1 % each):

1. Lactose
2. Saccharose
3. Galactose
4. Glucose
5. Fructose
6. Arabinose
7. Xylose
8. Ribose

Nano-SIL DIOL G diol-modified HPTLC silica layers

🔧 Technical characteristics

- Nano silica 60, mean pore size 60 Å, specific surface (BET) ~ 500 m²/g, specific pore volume 0.75 mL/g, pH stability 2–8, particle size 2–10 µm
- Indicator: acid-resistant product with a pale blue fluorescence for short-wave UV (254 nm), UV-absorbing substances appear as dark-blue to black spots on a light-blue background

🔧 Modification

- Diol modification, carbon content 5.5 %
- Order of polarity: silica > DIOL > NH₂ > CN > RP-2 > C18-50 > RP-18 W > C18-100
- Layer can be wetted equally well with pure water as with organic solvents

✅ Recommended application

- Steroids, pesticides and plant constituents
- For critical separations an alternative to silica
- Since it is less sensitive to the water content of the environment, leads to more reproducible results compared to silica

Separation of herbicides

MN Appl. No. 401950

Layer: Nano-SIL DIOL/UV
 Sample volume: 2 µL
 Eluent: petroleum ether (40–60 °C) – acetone (80:20, v/v)
 Migration distance: 70 mm
 Detection: TLC scanner, 230 nm

Peaks:
 (0.07 % each in methanol)

1. Metoxuron
2. Monuron
3. Metobromuron

Alox **G P A** aluminum oxide layers**🔧** Technical characteristics

- Aluminum oxide, mean pore size 60 Å, specific surface (BET) ~ 200 m²/g
- Inert organic binder
- Indicator: manganese-activated zinc silicate

✔ Recommended application

- Terpenes, alkaloids, steroids, aliphatic and aromatic compounds
- We recommend to activate aluminum oxide layers before use by heating 10 minutes at 120 °C

Separation of bisadducts of fullerenes

MN Appl. No. 401930

F. Djojo, A. Hirsch, Chem. Eur. J. 4 (1998), 344–356

Layer: ALUGRAM® Alox N/UV₂₅₄
 Eluent: toluene – ethyl acetate (95:5, v/v)
 Detection: UV, 254 nm

Compound	R _f values
Bis[bis(4-phenyloxazolin)methane]fullerene 1	0.14
Bis[bis(4-phenyloxazolin)methane]fullerene 2	0.26

Separation of lipophilic dyes

MN Appl. No. 403010

Layer: Alox-25 UV₂₅₄
 Sample volume: 1000 nL
 Eluent: toluene – cyclohexane (2:1, v/v)
 Migration distance: 108 mm in 15 min
 Detection: TLC scanner, UV 254 nm

Peaks:

1. Indophenol
2. Sudan red G
3. Sudan blue II
4. Butter yellow

CHIRALPLATE ^G special layer enantiomer separation

Technical characteristics

- Reversed phase nano silica impregnated with Cu²⁺ ions and a chiral selector (proline derivative)
- Separation based on ligand exchange, i.e. formation of ternary mixed-ligand complexes with the Cu(II) ions, differences in the stability of the diastereomeric complexes cause chromatographic separation

Recommended application

- Enantiomer separation of amino acids, *N*-methylamino acids, *N*-formylamino acids, α -alkylamino acids, thiazolidine derivatives, dipeptides, lactones, α -hydroxycarboxylic acids

Enantiomer separation of amino acids

MN Appl. No. 400520

Quantitative determination (remission location curves) of TLC-separated enantiomers of *tert.*-leucine:

Layer: CHIRALPLATE
 Eluent: methanol – water (10:80, v/v)
 Detection: dip in 0.3 % ninhydrin solution
 quantification with scanner, 520 nm

- a) L-*tert.*-leucine
 b) L-*tert.*-leucine + 0.1 % D-*tert.*-leucine
 c) L-*tert.*-leucine + 1 % D-*tert.*-leucine

Layers for special TLC separations

IONEX ^P special mixed layers of silica with ion exchange resins

IONEX-25 SA-Na:

- Mixture of silica and a strongly acidic cation exchanger coated to polyester sheets

IONEX-25 SB-AC:

- Mixture of silica and a strongly basic anion exchanger coated to polyester sheets
- Both layers contain an inert organic binder

✓ Recommended application

- Amino acids, e.g., in protein and peptide hydrolyzates, in seeds and fodder, in biological fluids; for racemate separation in peptide syntheses, for the separation of nucleic acid hydrolyzates, aminosugars, amino acids, antibiotics, inorganic phosphates, cations and other compounds with ionic groups

Chromatography papers

Chromatography papers

- Paper chromatography is the oldest chromatographic technique separation due to partition of the analytes between special paper grades and the mobile phase, which penetrates the paper by capillary action ascending.
- Descending and circular techniques are possible

Please note

- Always treat chromatography papers with care
- Never touch them with fingers, because this will contaminate the surface
- Do not bend them sharply, because this will decrease the capillary action (preferably store them flat)

Direction

- Chromatography papers possess a preferred direction of the fibers with higher absorption properties (with our sheets 58 x 60 cm, the longer edge)
- We recommend to use them in the direction of higher absorption

The GC system

Configuration of a gas chromatograph

- ① Gas supply: carrier gas and - if necessary - detector gases e.g., for FID detector
- ② Sample injector: During direct injection, the sample is applied to the column without touching any other parts made from glass or metal (on-column injection). During indirect injection, the sample is brought into an evaporator and is then transferred onto the column either completely, or partially (split technique). Both techniques allow working at low temperatures, high temperatures and the use of temperature programming.
- ③ Capillary column: the heart of the GC system
- ④ Temperature-controlled oven
- ⑤ Detector: indicates a substance by generating an electrical signal (response). Some detectors are specific for certain classes of substances or for certain elements (e.g., P, N).
- ⑥ Data station for configuration of a gas chromatograph

The separation process

Chromatographic separation is achieved through continuous distribution of each sample component between the mobile and the stationary phase:

In GC, the mobile phase is always a gas, mostly either He, N₂ or H₂.

The stationary phase is often a viscous, gum-like liquid adhered to the inner wall of a capillary column (WCOT = Wall Coated Open Tubular).

Transport of the components occurs exclusively in the mobile phase, while separation only takes place in the stationary phase. The quality of a separation (resolution) depends on the residence time of the components within the stationary phase and on the rate of interactions. The type of interaction between component and phase (selectivity) is determined by the functional groups of the stationary phase. The polarity of the phase is a function of its substituents.

The chromatogram

A chromatogram consists of a base line and a number of peaks. The area of a peak allows quantitative determinations:

A: starting point of a chromatogram = time of injection of a dissolved solute

A component can be identified by its retention time (qualitative determination):

$$t_{Ri} = t_0 + t'_{Ri}$$

t_0 : dead time = residence time of a solute in the mobile phase (time required by a component to migrate through the chromatographic system without any interaction with the stationary phase)

t_{Ri} : retention time = time interval between peak i and the point of injection

t'_{Ri} : net retention time = difference between total retention time and dead time t_0 . It indicates how long a substance stays in the stationary phase.

Other terms characterizing a separation:

k'_i : retention factor: a measure for the position of a sample peak in the chromatogram. The retention factor is specific for a given compound and constant under constant conditions.

$$k'_i = \frac{t_{Ri} - t_0}{t_0}$$

α : relative retention, also called separation factor or selectivity coefficient, is the ratio of two capacity factors. The reference substance is always in the denominator.

$$\alpha = \frac{k'_2}{k'_1}$$

The relative retention does not provide any information on the quality of a separation. For equal values of α two very broad peaks may overlap (as shown in a), or may be completely resolved (as in b), if they are accordingly narrow.

R: resolution: a measure for the quality of a separation, taking ($w_{1/2}$) into account according to:

$$R = 1.18 \cdot \frac{t_{R2} - t_{R1}}{(w_{1/2})_2 + (w_{1/2})_1}$$

N: number of theoretical plates: characterizes the quality of a column (should be determined for $k' > 5$). The height equivalent to a theoretical plate (h, HETP) is calculated by dividing the length L of the column by the number of theoretical plates Nth. The smaller this value the more efficient the column.

$$N = 5.54 \cdot \frac{(t_{R1})}{(w_{1/2})} \quad h = \text{HETP} = \frac{L}{N}$$

The Golay equation shows how the plate height h depends on the flow velocity u:

B: molecular axial diffusion; B is a function of the diffusion coefficient of the component in the respective carrier gas

C: resistance to mass transfer

In practice often higher velocities than $u_{opt.}$ are chosen, if separation efficiency is sufficient. Higher carrier velocities mean shorter retention times.

Parameters characterizing a capillary column

OPTIMA® 5	1.0 µm film	30 m x	0.32 mm ID
A	B	C	D

A. Stationary phase

Different chemical structures of stationary phases are responsible for the type of interaction (selectivity) between the phase and the analytes. The stationary phase also limits the temperature range for chromatography. For a detailed summary of MN phases for GC please see the following chapter.

B. Film thickness

MACHEREY-NAGEL offers ranges from 0.1 to 5.0 µm. The standard film thickness is 0.25 µm. Thin films (0.1–0.2 µm) are very well suited for high-boiling, temperature-sensitive or almost contemporaneously eluting substances.

Increasing the film thickness will increase the capacity, the retention for low-boiling substances and the inertness of the column. This is especially helpful for samples with a broad range of concentrations, or the separation of volatile polar substances.

A better coverage of the column wall by a thicker film and a reduced column surface due to a shorter column have a positive impact on the separation of very active substrates, that may cause noticeable tailing when they come in contact with non-coated spots of the column wall.

Thick films, however, always mean more stationary phase in the column, hence increased column bleeding. Therefore, maximum operating temperatures for thick-film columns are reduced. In addition, thick-film columns may have a lesser separating capacity.

C. Column length

The separating efficiency (better the number of plates N) of a column is directly proportional to its length. Most routine separations are carried out on 25 or 30 m columns, while more complex samples may require 50 or 60 m. 10 m columns are common for Fast GC (see page 340).

D. Inner diameter (ID)

The lower the ID, the higher is the theoretically possible number of plates per meter.

0.1–0.2 mm ID:

for high resolution and short retention times at low carrier gas flow

0.25 mm ID:

for analysis of complex mixtures

0.32 mm ID:

for routine analysis with short retention times, but increased capacity

0.53 mm ID:

for rapid separations with inert surface and highest capacity

USP listing of MN GC phases			
Code	Specifications	MN GC phases	Page

Scope of delivery

Each column is individually tested and supplied with test certificate and test chromatogram, but without fittings or ferrules. Columns have fused ends or are sealed with septa, to protect them from atmospheric oxygen. Further more an instruction leaflet is enclosed.

OPTIMA 5 MS

Column data:
 Ref: 726 600.30
 Length: 30 m
 ID: 0.25 mm
 Phase: 5% Phenylmethylsiloxane

Test conditions:
 Carrier gas: N₂
 Inlet temperature: 250 °C
 Oven temperature: 40 °C
 Detector: FID

Quality specifications - Test results:

Parameter	Value	Specification
Efficiency	1000000	> 1000000
Resolution	1.05	> 1.05
Reproducibility	0.15	< 0.15

Check of quality specifications: GC 1000000

Notes: All columns are tested and certified according to the specifications. The test results are available on request. For more information, please contact our technical support.

MN
Macherey-Nagel

GC cages

The standard size of a GC cage is 7 inches. On request, all columns can be supplied on a 5 inch (13 cm) cage e.g., for the Agilent GC 6850. To order, please add an E at the end of the REF number (e.g., 726470.30E)

7 inches standard size e.g., REF 726600.30

5 inches special cage e.g., REF 726600.30E

Integrated guard column

To prolong column life, even at highly contaminated or matrix-containing samples, MN offers the option to add an integrated guard column. All capillary columns are available with a 10 m guard column with respective deactivation. To order, please add V1 at the end of the REF number (e.g., 726600.30V1). Guard column combinations with other lengths, IDs or different deactivation are available on request.

Without integrated guard column e.g., REF 726600.30

With integrated guard column e.g., REF 726600.30V1

MACHEREY-NAGEL derivatization reagents

Purpose of derivatization

- Improved volatility, better thermal stability or a lower limit of detection in gas chromatography
- Prerequisite: quantitative, rapid and reproducible formation of only one derivative
- Halogen atoms inserted by derivatization (e.g., trifluoroacetates) for specific detection (ECD) with the advantage of high sensitivity
- Influence of elution orders and fragmentation patterns in MS by a specific derivatization
- We provide reagents for
 - Silylation
 - Alkylation (methylation)
 - Acylation
- For 1 x 10 mL, 1 x 50 mL and 6 x 50 mL also as screw neck vial
- Product range from page 357 onwards

Separation properties of OPTIMA® phases

increasing polarity

Peaks:

1. Undecane
2. Dodecane
3. Octanol
4. Dimethylaniline
5. Decylamine
6. Methyl decanoate
7. Methyl undecanoate
8. Henicosaane
9. Docosane
10. Tricosane

All columns:

0.25 µm film, 30 m x 0.25 mm ID
 Sample: MN OPTIMA® test mixture (REF 722316)
 Injection: 1.0 µL, split 15 mL/min
 Carrier gas: 0.80 bar He
 Temperature: 80 °C T_{max} (isothermal), 8 °C/min (20 min T_{max})
 Detector: FID 260–280 °C

Summary of MN phases for GC

Overview of OPTIMA® MN phases

Phase	Composition	Page	Relative polarity ^①	Maximum temperature ^②
OPTIMA® 1		310		
OPTIMA® 1 MS	100 % dimethylpolysiloxane	312		340 / 360 °C
OPTIMA® 1 MS Accent		312		
OPTIMA® 5	5 % phenyl – 95 % methylpolysiloxane	314		340 / 360 °C
OPTIMA® 5 MS	5 % diphenyl – 95 % dimethylpolysiloxane	315		340 / 360 °C
OPTIMA® 5 MS Accent	silarylene phase with selectivity similar to 5 % diphenyl – 95 % dimethylpolysiloxane	316		340 / 360 °C
OPTIMA® XLB	silarylene phase like above, optimized silarylene content for low bleeding	317		340 / 360 °C
OPTIMA® 5-3	phase with autoselectivity ^④	319		340 / 360 °C
OPTIMA® 5-6	phase with autoselectivity ^④	320		340 / 360 °C
OPTIMA® 1301	6 % cyanopropylphenyl – 94 % dimethylpolysiloxane	321		300 / 320 °C
OPTIMA® 1301 MS	silarylene phase with low bleeding: polarity similar to 6 % cyanopropylphenyl – 94 % dimethylpolysiloxane	322		300 / 320 °C
OPTIMA® 624	6 % cyanopropylphenyl – 94 % dimethylpolysiloxane	323		
OPTIMA® 624 LB	like above, phase with low bleeding	323		280 / 300 °C
OPTIMA® 1701	14 % cyanopropylphenyl – 86 % dimethylpolysiloxane	324		280 / 300 °C
OPTIMA® 1701 MS	silarylene phase with low bleeding: polarity similar to 14 % cyanopropylphenyl – 86 % dimethylpolysiloxane	325		280 / 300 °C

① = nonpolar, = polar

② First temperature (long term temperature) for isothermal operation, second value for the max. temperature (short term temperature) in a temperature program. Please note that for details refer to the description of individual phases.

③ Phases which provide a similar selectivity based on chemical and physical properties ④ See description on page 318

OPTIMA® · nonpolar capillary columns

OPTIMA® 1 100 % dimethylpolysiloxane · USP G1 / G2 / G38

★ Key features

- Nonpolar phase
- Structure see page 307

✓ Recommended application

- Separation of components according to boiling points
- Thick film columns $\geq 3 \mu\text{m}$ film are especially recommended for solvent analysis.

✍ Temperature

- Columns with 0.1–0.32 mm ID and films $< 3 \mu\text{m}$:
 T_{max} 340 °C (long-term temperature),
 T_{max} 360 °C (short-term max. temperature in a temperature program)
- 0.53 mm ID, films $< 3 \mu\text{m}$:
 T_{max} 320 and 340 °C, resp.
- Thick film columns with films $\geq 3 \mu\text{m}$:
max. temperatures 300 and 320 °C, resp.

OPTIMA® 1 MS Accent 100 % dimethylpolysiloxane · USP G1 / G2 / G38

★ Key features

- Selectivity identical to OPTIMA® 1, nonpolar phase
- Lowest column bleed
- Solvent rinsing for removal of impurities applicable
- Increased sensitivity due to an unmatched low background level
- Structure see page 307

✓ Recommended application

- Ideal for ion trap and quadrupole MS detectors
- Perfect inertness for basic compounds
- All-round phase for environmental analysis, trace analysis, EPA methods, pesticides, PCB, food and drug analysis

✍ Temperature

OPTIMA® · weakly polar capillary columns

OPTIMA® 5 MS Accent silarylene phase · USP G27 / G36

★ Key features

- Chemically bonded, cross-linked silarylene phase with polarity similar to a 5 % diphenyl - 95 % dimethylpolysiloxane phase
- Lowest column bleed, nonpolar phase, solvent rinsing for removal of impurities applicable
- Structure see page 307

✓ Recommended application

- Ideal for ion trap and quadrupole MS detectors
- Perfect inertness for basic compounds
- All-round phase for environmental analysis, trace analysis, EPA methods, pesticides, PCB, food and drug analysis

✍ Temperature

- T_{max} 340 °C (long-term temperature), T_{max} 360 °C (short-term max. temperature in a temperature program)
- Film thickness > 0.5 µm:
 T_{max} 320 and 340 °C, resp.

Similar phases

- DB-5, DB-5MS, HP-5MS, Ultra-2, Equity™-5, CP-Sil 8CB low bleed/MS, Rxi®-5MS, Rtx®-5SIL-MS, Rtx®-5MS, 007-5MS, BPX™5, MDN-5S, AT™-5MS, VF-5MS

Increased sensitivity due to an unmatched low background level

The bleed comparison test of OPTIMA® 5 MS Accent with a conventional 5 MS phase shows the outstanding performance of the silarylene phase.

The unmatched low background level of the OPTIMA® 5 MS Accent, which is approximately three times lower compared to a 5 MS brand column, provides significantly increased sensitivity and allows its application in trace analysis particularly of high-boiling compounds.

Background noise at 340 °C

Range of polarities covered by OPTIMA® δ phases

All stationary GC phases can be classified by their polarities. While the selectivity of common GC phases is generally determined by permanent dipole-dipole interactions, OPTIMA® δ -3 and OPTIMA® δ -6 show an additional feature. Large, polarizable groups in the polymer chain of the stationary phase enable the analyte to induce a further dipole moment that increases

with the polarity of said analyte. We call this phenomenon “Autoselectivity”, because the column adjusts itself to the polarity of the analyte. The implemented polymers consist of cross-linked polysiloxanes with a defined composition and an extremely narrow distribution of molecular weight.

OPTIMA® δ phases cover broad ranges of polarities. Compared with conventional phases, OPTIMA® δ -3 polarity ranges from approximately the nonpolar OPTIMA® 5 to the midpolar OPTIMA® 1701, while for OPTIMA® δ -6 the polarity covers a range from about the midpolar OPTIMA® 17 to the polar OPTIMA® 210.

OPTIMA® δ phases show high temperature limits (340 / 360 °C), as well as low bleed levels, which makes them ideal for the use with mass selective (MSD) or phosphorus/nitrogen detectors (PND) in the field of environmental trace analysis.

Isomeric phenols, such as chloro- and nitrophenols, are difficult to analyze with standard GC phases (e.g., OPTIMA® 5 or OPTIMA® 17) because of co-elutions. The autoselective OPTIMA® δ -3 is able to separate all 22 phenols due to stronger interactions occurring with more polar molecules, because polar analytes induce a dipole moment in the phase of the OPTIMA® δ -3 (see chromatogram page 319).

Separation characteristics of OPTIMA® δ phases

Conditions and peaks (see page 305)

Key features of OPTIMA® δ phases

- Wide range of application due to autoselectivity
- Outstanding thermal stability similar to nonpolar phases
- Low bleed levels
- Medium polar without CN groups

Ordering information about OPTIMA® δ phases can be found on page 319 and page 320.

OPTIMA[®] δ-3 polysiloxane phase with autoselectivity · USP G49

★ Key features

- Medium polar without CN groups
- Autoselectivity resulting in a polarity range from approximately the nonpolar OPTIMA[®] 5 to the midpolar OPTIMA[®] 1701 (see page 318)
- Analytes determine the polarity of the phase

✓ Recommended application

- Ideal for MSD and PND detectors

✍ Temperature

- 0.1–0.32 mm ID:
T_{max} 340 °C (long-term temperature),
T_{max} 360 °C (short-term max. temperature in a temperature program)

OPTIMA[®] · medium polar capillary columns

OPTIMA[®] 35 MS silarylene phase · USP G42 / close equivalent to USP G28 / G32

★ Key features

- Chemically bonded cross-linked silarylene phase with selectivity similar to 35 % phenyl – 65 % methyl polysiloxane, midpolar phase, polymer without CN groups
- Very low column bleeding
- Structure see page 309

✓ Recommended application

- Ideal for ion trap detectors
- Optimum column for confirmation of analytical results in combination with a 1 MS or 5 MS
- All-round phase for environmental analysis, ultra trace analysis, EPA methods, pesticides, PCB, food and drug analysis

✍ Temperature

- T_{max} 360 °C (long-term temperature), T_{max} 370 °C (short-term max. temperature in a temperature program)

OPTIMA[®] 17 MS silarylene phase · USP G3

★ Key features

- Medium polar silarylene phase with selectivity analogue to 50 % phenyl – 50 % methylpolysiloxane, no CN groups in the polymer
- Structure see page 309

✓ Recommended application

- Ideal for ion trap detectors
- Optimum reference column in combination with a 1 MS or 5 MS
- All-round phase for environmental analysis, ultra-trace analysis, EPA methods, pesticide, PCBs, food and drug analysis

✍ Temperature

- T_{max} 340 °C (long-term temperature),
- T_{max} 360 °C (short-term max. temperature in a temperature program)

Similar phases

- OV-17, AT[™]-50, BPX[™]-50, DB-17, DB-17ms, HP-50+, HP-17, SPB[™]-50, SPB[™]-17, SP-2250, Rtx[®]-50, CP-Sil 24 CB, 007-17, VF-17ms, ZB-50

Analysis of phenols

MN Appl. No. 213600

Column: OPTIMA[®] 17 MS, 30 m x 0.25 mm ID, 0.25 µm film
 Sample: phenol mix 604
 Injection: 1.0 µL, 230 °C, split 1:30
 Carrier gas: 0.8 bar He
 Temperature: 100 °C, 10 °C/min → 250 °C
 Detector: FID 280 °C

Peaks:

1. Phenol
2. 2-Chlorophenol
3. 2,4-Dimethylphenol
4. 2-Nitrophenol
5. 2,4-Dichlorophenol
6. 4-Chloro-3-methylphenol
7. 2,4,6-Trichlorophenol
8. 4-Nitrophenol

OPTIMA[®] 210 trifluoropropyl-methylpolysiloxane (50 % trifluoropropyl) · close equivalent to USP G6

★ Key features

- Midpolar phase
- Structure see page 309

✓ Recommended application

- Environmental analysis, especially for *o*-, *m*- and *p*-substituted aromatic hydrocarbons

✍ Temperature

- T_{max} 260 °C (long-term temperature),
T_{max} 280 °C (short-term max. temperature in a temperature program)

Similar phases

- OV-210, DB-210, Rtx[®]-200, 007-210

Aromatic hydrocarbons (BTX)

MN Appl. No. 200230

Column: OPTIMA[®] 210, 50 m x 0.25 mm ID, 0.5 µm film
 Injection: 0.5 µL, split 105 mL/min
 Carrier gas: 130 kPa N₂ (1.1 mL/min)
 Temperature: 50 °C
 Detector: FID 250 °C

Peaks:

1. Benzene
2. Toluene
3. Ethylbenzene
4. *p*-Xylene
5. *m*-Xylene
6. *o*-Xylene

Capillary columns for special GC separations

Certain analytical separations can be accomplished more easily with chromatographic columns, that have been especially developed for that task, compared with standard columns. The

following table summarizes our program of GC speciality capillaries, the individual columns will be described in detail on the following pages.

Overview		
Separation/special application	Recommended capillary column	Page
Fast GC column with 0.10 mm ID	OPTIMA® 1, OPTIMA® 5, OPTIMA® δ-3, OPTIMA® δ-6 OPTIMA® 17, OPTIMA® 225, OPTIMA® FFAP PERMABOND® CW 20 M, PERMABOND® FFAP	340
Enantiomer separation cyclodextrin phases	FS-LIPODEX® A, FS-LIPODEX® B, FS-LIPODEX® C FS-LIPODEX® D, FS-LIPODEX® E, FS-LIPODEX® G	342
	FS-HYDRODEX β-PM, FS-HYDRODEX β-3 P, FS-HYDRODEX β-6TBDM, FS-HYDRODEX β-6TBDE, FS-HYDRODEX β-6TBDE, FS-HYDRODEX β-TBDAC, FS-HYDRODEX γ-DIMOM	344
Biodiesel		
Methanol analysis	OPTIMA® BioDiesel M	346
FAME analysis	OPTIMA® BioDiesel F	346
Glycerol and triglycerides	OPTIMA® BioDiesel G	346
Triglycerides		
	OPTIMA® 1-TG	348
	OPTIMA® 17-TG	348
High temperature GC		
	OPTIMA® 5 HT	349
Amines		
Polyfunctional amines	OPTIMA® 5 Amine	350
Amine separations	FS-CW 20 M-AM	351
Petrochemical products (complex hydrocarbon mixtures)		
	PERMABOND® P-100	352
Environmental analysis of volatile halogenated hydrocarbons		
	PERMABOND® SE-54 HKW	352
Silanes (monomeric, e.g., chlorosilanes)		
	PERMABOND® Silane	354
Diethylene glycol, e.g., for the quality control of wine		
	PERMABOND® CW 20 M-DEG	354

Fast GC

★ Key features

- Decreased column diameters, high heating rates and decreased column lengths for faster GC separations with high resolution efficiency
- Small inner diameters combined with very fast temperature programs can reduce the analysis time by up to 80 %
- High sensitivity detectors with small volume and very short response time, as well as very rapid data acquisition and processing
- Small inner diameters result in high column inlet pressures and a lower volume flow of the mobile phase: very fast injection of very small samples against a high pressure
- Amount of sample, which can be injected, is limited by the inner diameter and the thin film

✎ Temperature

- High heating rates place special demands on stationary phases. OPTIMA® columns meet exactly this requirement: very low bleeding, long lifetimes, even for continuous high heating rates

Comparison of a separation on a 50 m standard capillary with separation on a 10 m fast GC column
MN Appl. No. 211260

Peaks:

1. Octanol
2. Undecane
3. Dimethylaniline
4. Dodecane
5. Decylamine
6. Methyl decanoate
7. Methyl undecanoate
8. Henicosane
9. Docosane
10. Tricosane

A) Fast GC column

Column: OPTIMA® 5, 10 m x 0.1 mm ID,
0.1 µm film
Injection 1 µL, split 1:40,
Carrier gas 0.75 bar He

B) standard GC column

Column: OPTIMA® 5, 50 m x 0.25 mm ID,
0.25 µm film
Injection 1 µL, split 1:35,
Carrier gas 1.5 bar He

Both separations:

Temperature: 80 °C → 320 °C (10 min), 8 °C/min

Detector: FID

While maintaining the temperature program and halving the pressure a time saving of 30 % results with identical separation efficiency.

In addition to this standard program, all MN GC phases can be custom-made as fast GC columns

Further applications can be found online in our application database at www.mn-net.com/apps

LIPODEX® cyclodextrin phases for enantiomer separation

★ Key features

- Base material: cyclic oligosaccharides consisting of six (α -cyclodextrin), seven (β -cyclodextrin) or eight (γ -cyclodextrin) glucose units bonded through 1,4-linkages
- Regioselective alkylation and / or acylation of the hydroxyl groups leads to lipophilic phases with varying enantioselectivity, which are well suited for GC enantiomer analysis
- Important advantage: many compounds can be analyzed without derivatization (however, for certain substances enantioselectivity can be favorably influenced by formation of derivatives)

✓ Recommended application

- A large number of separations have been achieved, however, it is not possible to make a general prediction, which phase could solve a given separation task. Even for compounds with small structural differences or within homologous series the enantiodifferentiation can be quite different. The following table shows typical applications.

Note:

- Water as solvent is strictly forbidden for all cyclodextrin phases
- Dry the sample with our CHROMAFIX® Dry (Na_2SO_4) cartridges (see page 61)
- Use suitable nonpolar solvent

Phase	Cyclodextrin derivate	T _{max} [°C]	Recommended application
LIPODEX® A	hexakis-(2,3,6-tri-O-pentyl)- α -CD	200 / 220	carbohydrates, polyols, diols, hydroxycarboxylic acid esters, (epoxy-) alcohols, glycerol derivatives, spiroacetals, ketones, alkyl halides
LIPODEX® B	hexakis-(2,6-di-O-pentyl-3-O-acetyl)- α -CD	200 / 220	lactones, diols (cyclic carbonates), aminols, aldols (O-TFA), glycerol derivatives (cyclic carbonates)
LIPODEX® C	heptakis-(2,3,6-tri-O-pentyl)- β -CD	200 / 220	Alcohols, cyanhydrins, olefins, hydroxycarboxylic acid esters, alkyl halides
LIPODEX® D	heptakis-(2,6-di-O-pentyl-3-O-acetyl)- β -CD	200 / 220	aminols (TFA), β -amino acid esters, trans-cycloalkane-1,2-diols, trans-cycloalkane-1,2-diols, trans-cycloalkane-1,3-diols (TFA)
LIPODEX® E	octakis-(2,6-di-O-pentyl-3-O-butyl)- γ -CD	200 / 220	α -amino acids, α - and β -hydroxycarboxylic acid esters, alcohols (TFA), diols (TFA), ketones, pheromones (cyclic acetals), amines, alkyl halides, lactones
LIPODEX® G	octakis-(2,3-di-O-pentyl-6-O-methyl)- γ -CD	220 / 240	menthol isomers, ketones, alcohols, carboxylic acid esters, terpenes

HYDRODEX cyclodextrin phases for enantiomer separation

Recommended application

- Cyclodextrin derivatives (see page 343) with high melting point: for GC enantiomer separation diluted with polysiloxanes

Enantiomer separation of dichlorprop methyl ester

MN Appl. No. 202542

Column: FS-HYDRODEX β -3P, 25 m x 0.25 mm ID
 Injection: 0.1 μ L (~1 % in CH_2Cl_2), split 130 mL/min
 Carrier gas: 60 kPa H_2 (1.9 mL/min)
 Temperature: 160 $^\circ\text{C}$
 Detector: FID 250 $^\circ\text{C}$

Separation of isomeric antiinflammatory drugs

MN Appl. No. 210150

Courtesy of Prof. W.A. König, Hamburg, Germany
 Column: FS-HYDRODEX β -6TBDM, 25 m x 0.25 mm ID
 Carrier gas: He
 Temperature: 135 $^\circ\text{C}$ \rightarrow 200 $^\circ\text{C}$, 1 $^\circ\text{C}/\text{min}$
 Detector: FID

Peaks:

1. Ibuprofen

4. Naproxen

2. Flurbiprofen

5. Ketoprofen

3. Fenoprofen

Phase	Cyclodextrin derivative (diluted with optimized polysiloxane)	T_{max} [$^\circ\text{C}$]	Recommended application
HYDRODEX β -PM	heptakis-(2,3,6-tri-O-methyl)- β -CD	230 / 250	hydroxycarboxylic acid esters, alcohols, diols, olefins, lactones, acetals
HYDRODEX β -3P	heptakis-(2,6-di-O-methyl-3-O-pentyl)- β -CD	230 / 250	terpenes, dienes, allenes, terpene alcohols, 1,2-epoxyalkanes, carboxylic acids (esters), hydroxycarboxylic acid esters, pharmaceuticals, pesticides
HYDRODEX β -6TBDM	heptakis-(2,3-di-O-methyl-6-O-t-butyl-dimethyl-silyl)- β -CD	230 / 250	γ -lactones, cyclopentanones, terpenes, esters, tartrates
HYDRODEX β -6TBDE	heptakis-(2,3-di-O-ethyl-6-O-t-butyl-dimethyl-silyl)- β -CD	230 / 250	essential oils
HYDRODEX β -TBDAc	heptakis-(2,3-di-O-acetyl-6-O-t-butyl-dimethyl-silyl)- β -CD	220 / 240	alcohols, esters, ketones, aldehydes, δ -lactones
HYDRODEX γ -TBDAc	octakis-(2,3-di-O-acetyl-6-O-t-butyl-dimethyl-silyl)- γ -CD	220 / 240	cyclic ketones, aromatic ketones, oxiranes, aromatic esters, aromatic amides
HYDRODEX γ -DIMOM	octakis-(2,3-di-O-methoxymethyl-6-O-t-butyl-dimethyl-silyl)- γ -CD	220 / 240	ketones, terpenes, cyclic ethers, alcohols, amines

Capillary columns for enantiomer separation

Separation of (R/S) citronellol + citronellal

MN Appl. No. 212440

Column: FS-HYDRODEX β -TBDAC, 50 m x 0.25 mm ID
 Injection: 1 μ L, 1:1000 in CH₂Cl₂, split 25 mL/min
 Carrier gas: 1.5 bar H₂
 Temperature: 100 °C
 Detector: FID 220 °C

Peaks:

1. (R)/(S)-Citronellal
2. (S)/(R)-Citronellal
3. (S)-Citronellol
4. (R)-Citronellol

Separation of essential oils

MN Appl. No. 212980/212990/213000

Column: FS-HYDRODEX γ -TBDAC, 50 m x 0.25 mm ID
 Injektor: 220 °C
 Carrier gas: 1.2 bar H₂
 Temperature: 125 °C
 Detector: FID 220 °C

Peaks:

1. Fenchone (1.5 mg/mL)
2. Menthone (0.5 mg/mL)
3. Menthol (2 mg/mL)

OPTIMA® BioDiesel for the analysis of biodiesel (DIN EN 14214 / ASTM D 6751)

OPTIMA® BioDiesel M for analysis of methanol in accordance with DIN EN 14110

★ Key features

- The methanol content in biodiesel as specified in DIN EN 14110 must not exceed 0.2 %. The column OPTIMA® BioDiesel M allows the GC headspace analysis of the methanol content in biodiesel in the concentration range from 0.01 to 0.5 % with 2-propanol as internal standard.

✍ Temperature

- T_{\max} 340 °C (long-term temperature),
 T_{\max} 360 °C (short-term max. temperature in a temperature program)

Similar phases

- Select™ Biodiesel for Methanol, Trace TR-BioDiesel (M)

OPTIMA® BioDiesel F for analysis of FAMES in accordance with DIN EN 14103:2011

★ Key features

- The analysis of biodiesel requires separation of typical FAMES between myristic acid (C_{14}) and nervonic acid ($C_{24:1}$) methyl esters. This analysis is possible on OPTIMA® BioDiesel F in only 22 min. Additionally, linolenic acid methyl ester can be determined due to the good resolution. The extended standard DIN EN 14103:2011 also covers smaller FAMES starting from C_6 (see application 214510 on opposite page). Change of the internal standard from C_{17} to C_{19} also allows the analysis of animal fats.

✍ Temperature

- T_{\max} 240 °C (long-term temperature),
 T_{\max} 250 °C (short-term max. temperature in a temperature program)

Similar phases

- Select™ Biodiesel for FAME, Trace TR-BioDiesel (F)

OPTIMA® BioDiesel G for analysis of glycerol and glycerides in accordance with DIN EN 14105

★ Key features

- The capillary column OPTIMA® BioDiesel G allows determination of free glycerol and residues of mono-, di- and triglycerides in FAMES intended as additives for mineral oils. The procedure can be applied for FAMES from rapeseed oil, sunflower oil and soy bean oil. Glycerol as well as mono- and diglycerides are derivatized to more volatile substances by addition of MSTFA in the presence of pyridine (see page 363).

✍ Temperature

- T_{\max} 380 °C (long-term temperature),
 T_{\max} 400 °C (short-term max. temperature in a temperature program)

Similar phases

- Select™ Biodiesel for Glycerides, Trace TR-BioDiesel (G), MET-Biodiesel

Capillary columns for biodiesel analysis

Analysis of FAMES from biodiesel in accordance with DIN EN 14103:2011

MN Appl. No. 214510

Column: OPTIMA® BioDiesel F, 30 m x 0.25 mm ID
 Sample: 50 µg/mL each in dichloromethane
 Injection: 10 µL, 250 °C, split 1:20
 Carrier gas: 1.2 bar He
 Temperature: 80 °C → 250 °C (8.5 min), 20 °C/min
 Detector: FID 260 °C

Capillary columns for high temperature GC

OPTIMA® 5 HT for high temperature GC · USP G27 / G36

★ Key features

- Chemically bonded, cross-linked silarylene phase with polarity similar to a 5 % diphenyl - 95 % dimethylpolysiloxane phase
- Nonpolar phase, low bleeding

Similar phases

- DB-5HT, VF-5HT, HT-5, XTI-5HT, ZB-5HT

✓ Recommended application

- Ideal for MS detectors, can be rinsed with solvents
- For simulated distillation, hydrocarbon, fuel and oil analysis, high-boiling analytes

✍ Temperature

- T_{max} 380 °C (long-term temperature), T_{max} 400 °C (short-term max. temperature in a temperature program)

Separation of motor oil / mineral oil (type A + B), rapid determination in accordance with DIN H-53 / ISO DIS

MN Appl. No. 213400

Column: OPTIMA® 5 HT, 15 m x 0.32 mm ID, 0.25 µm film
 Sample: mineral oil type A + B (hydrocarbon index kit acc. to EN ISO 9377-2) in hexane
 Injection: 1 µL, splitless, 300 °C
 Carrier gas: 0.6 bar He
 Temperature: 40 °C (5 min) → 390 °C, 50 °C/min
 Detector: FID 280 °C

Peaks:

1. Decane (C10)
2. Tetracontane (C40)

Capillary columns for amine separation

OPTIMA® 5 Amine special column for analysis of amines · USP G27 / G36

★ Key features

- Nonpolar phase
- Improved linearity for analysis of active components at trace levels: no amine absorptions even for aliphatic and aromatic amines at concentrations of 100 pg/peak
- Tested with the OPTIMA® Amine test mixture (REF 722317), which contains, amongst others, diethanolamine and propanol-pyridine (this test mixture is supplied with each column)

✓ Recommended application

- Especially deactivated for the analysis of polyfunctional amines such as ethanalamines, amino-functionalized diols and similar compounds, which are important base materials in industrial chemistry, and show strong tailing on standard-deactivated columns

✍ Temperature

- T_{max} 300 °C (long-term temperature), T_{max} 320 °C (short-term max. temperature in a temperature program)

Similar phases

- Rtx®-5 Amine, PTA-5

Separation of secondary and tertiary amines MN Appl. No. 210280

Column: OPTIMA® 5 Amine, 30 m x 0.25 mm ID, 1.0 µm film
 Injection: 1 µL, split 1:100

MACHEREY-NAGEL CHROMAFIL® syringe filters

Ideal for the filtration of GC, HPLC and UHPLC sample solutions

- Diverse membrane types and filter sizes for a variety of applications
- Optimal flow geometry because of star-shaped distribution device
- Lowest content of extractable substances
- Luer lock inlet, Luer outlet
- Prefiltration of solvents protects sensitive instrument parts and chromatography columns from solid contamination and increases their lifetime.

Find CHROMAFIL® products from page 81 onwards.

Capillary columns for hydrocarbons

PERMABOND® P-100 for analysis of petrochemical products · USP G1 / G2 / G38

★ Key features

- Extra long column with nonpolar dimethylpolysiloxane phase

✓ Recommended application

- High resolution and sufficient capacity for analysis of complex mixtures of hydrocarbons

✍ Temperature

- T_{max} 300 °C (long-term temperature), T_{max} 320 °C (short-term max. temperature in a temperature program)

Ordering information

PERMABOND® SE-54-HKW for volatile halogenated hydrocarbons · USP G36

✓ Recommended application

- SE-54 optimized for volatile halogenated hydrocarbons

✍ Temperature

- T_{max} 300 °C (long-term temperature), T_{max} 320 °C (short-term max. temperature in a temperature program)

For the analysis of halogenated hydrocarbons, we recommend our optimized column PERMABOND® SE-54-HKW at 25 or 50 m length with our approved polysiloxane phase SE-54.

As an alternative, or to verify analytical results, the OPTIMA® 624 has proven itself as advantageous, especially for the determination of 1,1,2-trichlorotrifluoroethane (F 113) along with dichloromethane.

Both phases are also suited for the determination of vinyl chloride as well as for the separation of cis/trans isomers of 1,2-dichloroethene. The high film thickness secures a high capacity and an outstanding resolution. For GC/MS coupling, we recommend OPTIMA® 624 LB or OPTIMA® 624 with 0.2 or 0.25 mm ID

Volatile halogenated hydrocarbons

MN Appl. No. 212480

Column: PERMABOND® SE-54-HKW, 50 m x 0.32 mm ID
 Injection: 1 µL, split ~ 1:30
 Carrier gas: 0.9 bar He
 Temperature: 35 °C (25 min) → 160 °C (5 min), 10 °C/min
 Detector: ECD 300 °C

Peaks:

1. Dichloromethane (795 ng/mL)
2. Trichloromethane (75 ng/mL)
3. 1,1,1-Trichloroethane (67 ng/mL)
4. 1,2-Dichloroethane (100 ng/mL)
5. Tetrachloromethane (15.9 ng/mL)
6. Trichloroethene (14.6 ng/mL)
7. Bromodichloromethane (20 ng/mL)
8. Dibromochloromethane (122 ng/mL)
9. Tetrachloroethene (81 ng/mL)
10. Tribromomethane (28.9 ng/mL)

Capillary columns for hydrocarbons

Volatile halogenated hydrocarbons and BTX

MN Appl. No. 200160

Column: OPTIMA® 624, 50 m x 0.25 mm ID, 1.40 µm film
 Injection: 1 µL, split 50 mL/min
 Carrier gas: 0.9 mL/min He (constant flow)
 Temperature: 40 °C (5 min) → 160 °C, 10 °C/min
 Detector: MSD 5971

Peaks:

- | | |

0.25 mm ID (0.4 mm OD)	723105.10	723105.25
0.32 mm ID (0.5 mm OD)	723349.10	723349.25
0.53 mm ID (0.8 mm OD)	723562.10	723562.25

Untreated capillaries are supplied without cage.

For a considerably longer lifetime, even for contaminated or matrix-containing samples, MN offers the option of integrated precolumns. All capillary columns are available with a 10 m guard column with matched deactivation. For ordering, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

Retention gaps

★ Key features

- The retention gap technique in combination with on-column injection allows to concentrate a large sample volume in the capillary column.
- Choice of the retention gap depends on the solvent used: the flooded zone after injection should be between 20–30 cm/ μ L
- Me-Sil retention gap:
only for use with *n*-hexane and diethyl ether
- Phe-Sil retention gap:
for all solvents except methanol and water
- CW retention gap:
for all solvents and especially for methanol and water

✎ Temperature

- T_{\max} 250 °C (CW retention gaps),
- T_{\max} 320 °C (Me-Sil and Phe-Sil retention gaps)

Note:

- Calculation example: length of flooded zone ~ 20–30 cm/ μ L, retention gap 10 m x 0.32 mm ID, capillary column: 25 m x 0.32 mm ID, max. injection volume ~ 30–50 μ L
- A retention gap must be inert without any noticeable retention: Me-Sil retention gaps are more inert than Phe-Sil, while Phe-Sil is less susceptible to contamination
- Retention gaps can also be used as transfer lines or precolumns (contamination capacity about 5–10 μ g).

Derivatization reagents

★ Key features

- Derivatization reagents:
To improve volatility, increase thermal stability or to achieve a lower limit of detection in gas chromatography
- Prerequisite: quantitative, rapid and reproducible formation of only one derivative
- Halogen atoms inserted by derivatization, e.g., trifluoroacetates, allow the specific detection in an ECD with the advantage of high sensitivity.
- Specific derivatizations may influence elution orders and fragmentation patterns in a MS
- We provide reagents for
 - acylation
 - alkylation (methylation)
 - silylation
- For 1 x 10 mL, 1 x 50 mL and 6 x 50 mL also available with screw closure

Ordering information

steroids	silylation		BSA, TSIM
	acylation		TFAA, MBTFA, HFBA, MBHFBA

These products contain harmful substances which must be specially labeled as hazardous. For detailed information please see SDS.

Due to their purpose, derivatization reagents are very reactive substances. For this reason, they should be stored cool and protected from moisture. For easy access with a syringe, our derivatization reagents are supplied in vials with crimp caps (exception DMCS and TMCS with screw closure). Vials with pierced sealing disks have limited stability and should be used soon.

The derivatization procedures can be found on page 367.

Acylation reagents

Acyl halides

★ Key features

- By-product of acylation with acyl halides: corresponding hydrohalic acids excess of reagent and acid have to be removed or trapped by a suitable base (e.g., pyridine)
- Pentafluorobenzoyl chloride
PFBC: $C_6F_5-CO-Cl$
M 230.52 g/mol, Bp 158–159 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.601$

Anhydrides

★ Key features

- By-products of acylation with anhydrides: corresponding acids excess reagent and the acid formed are to be removed
- Trifluoroacetic acid anhydride TFAA: $CF_3-CO-O-CO-CF_3$
M 210.04 g/mol, Bp 39.5–40.5 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.490$
- Heptafluorobutyric acid anhydride
HFBA: $C_3F_7-CO-O-CO-C_3F_7$
M 410.06 g/mol, Bp 106–107 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.665$

Bisacylamides

★ Key features

- By-products: corresponding neutral acylamides: high volatility
- Easily removed; due to the neutral conditions and their favorable chromatographic characteristics, the removal of surplus bisacylamides and their by-products is often not necessary. Therefore, the sample preparation is much easier.
- *N*-methyl-bis(trifluoroacetamide)
MBTFA: $CF_3-CO-N(CH_3)-CO-CF_3$
M 223.08 g/mol, Kp 123–124 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.55$
- *N*-methyl-bis(heptafluorobutyramide)
MBHFBA: $C_3F_7-CO-N(CH_3)-CO-C_3F_7$
M 423.1 g/mol, Kp 165–166 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.673$

Methods for acylation

Acylation with fluorinated acid anhydrides (TFAA, HFBA)

- Applicable for alcohols, phenols, carboxylic acids, amines, amino acids and steroids, stable derivatives for FID or ECD detection
- Procedure see page 367 or online at www.mn-net.com/apps
TFAA: MN Appl. Nr. 213041
HFBA: MN Appl. Nr. 213042

Acylation with fluorinated acid amides (MBTFA, MBHFBA)

- Recommended for alcohols, primary and secondary amines as well as for thiols under mild, neutral conditions
- MBTFA also forms very volatile derivatives with carbohydrates [17].
- Procedure see page 367 or online at www.mn-net.com/apps
MBTFA: MN Appl. Nr. 213051
MBHFBA: MN Appl. Nr. 21305

Methods for alkylation / methylation

Methylation with TMSH

- Suited for free acids, chlorophenoxy-carboxylic acids, their salts and derivatives as well as for phenols and chlorophenols [18]
- The great advantage is the simplification of the sample preparation. Lipids or triglycerides can be converted to the corresponding fatty acid methyl esters (FAMES) by simple transesterification.
- This reaction is very elegant and convenient, because it is only necessary to add the reagent (0.2 mol/L in methanol) to the sample solution. Removal of surplus reagent is not required, since at 250 °C inside the injector of the gas chromatograph, TMSH will pyrolyze solely to volatile methanol and dimethylsulfide. Due to high reactivity, a complete conversion is usually obtained at ambient temperature. Heating (e.g., 10 min at 100 °C) in a closed sample vial may be necessary, however.
- Procedure see page 367 or online at www.mn-net.com/apps
MN Appl. Nr. 213060

Methylation with DMF-DMA

- Applicable for fatty acids, primary amines and (partially) amino acids, under formation of *N*-dimethyl-aminomethylene amino acid methyl esters [19]
- Since DMF-DMA is a poor solvent, it is essential to use a mixture of DMF-DMA with pyridine, THF, acetone (barbiturates) or another solvent.
- Procedure see page 367 or online at www.mn-net.com/apps
MN Appl. Nr. 213070

Methylation with methanol – TMCS (1 M)

- Suited for the esterification of free carboxylic acids and the transesterification of glycerides. Formation of HCl catalyzes the reaction. TMCS, resp. silyl ethers remove the water and thus drive the reaction to completion. The mixture should be freshly prepared.
- Procedure see page 367 or online at www.mn-net.com/apps
MN Appl. Nr. 213080

For GC separation of FAMES from natural butter fat after derivatization with TMSH see Appl. 201680 at www.mn-net.com/apps

Silylation reagents

The most common form of silylation in GC is the replacing of active hydrogen atoms with a trimethylsilyl group (TMS derivative). Less frequently, trialkylsilyl groups or dimethylsilyl groups with longer alkyl chains are also in use. The alkylsilyl group increases volatility and enhances thermal stability of the sample.

Silylation can be catalyzed either acidic by addition of TMCS or basic by addition of pyridine or TSIM (e.g., for sterically hindered functionalities like tert. alcohols).

Reactivity of silylation reagents (acc. to M. Donike): TMS amide (e.g., BSA, MSTFA) > TMS amine = TSIM > Enol-O-TMS ether > S-TMS ether > O-TMS ether > TMS-O-TMS

Stability of the TMS derivatives: O-TMS ether > S-TMS ether > Enol-O-TMS ether > TMS amine > TMS amide

BSA *N,O*-bis-trimethylsilyl-acetamide

• M 203.4 g/mol,
Bp 71–73 °C (35 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 0.832$

★ Key features

- Strong silylation reagent
- Not recommended for use with carbohydrates or very low molecular weight compounds
- Good solvent for polar compounds, but frequently used in combination with a solvent (pyridine, DMF etc.) or with other silylation reagents. Dissolved in DMF, BSA is the prime derivatization reagent for phenols.

✔ Recommended application

- Alcohols, amines, carboxylic acids, phenols, steroids, biogenic amines and alkaloids are derivatized to stable TMS derivatives

BSTFA *N,O*-bis-trimethylsilyl-trifluoroacetamide

• M 257.4 g/mol,
Bp 40 °C (12 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 0.961$

★ Key features

- Powerful trimethylsilyl donor with approx. the same donor strength as the nonfluorinated analog BSA
- Advantage of BSTFA over BSA: greater volatility of its reaction products, particularly useful for GC analysis of low boiling TMS amino acids

- BSTFA is nonpolar (less polar than MSTFA) and can be mixed with acetonitrile for improved solubility. For the silylation of fatty acid amides, hindered hydroxyl groups and other difficult to silylate compounds, e.g., secondary alcohols and amines, we recommend BSTFA + 1 % trimethylchlorosilane (TMCS), available under the designation SILYL-991 (see page 366).

Silylation with BSA, BSTFA or SILYL-991 (BSTFA + 1 % TMCS)

On request for 1 x 10 mL, 1 x 50 mL and 6 x 50 mL also available with screw closure.

MSTFA *N*-methyl-*N*-trimethylsilyl-trifluoroacetamide

• M 199.1 g/mol,
Bp 70 °C (75 mm Hg),
Density d_{20°/4°} = 1.11

★ Key features

- The most volatile trimethylsilyl amide available, very strong TMS donor which does not cause noticeable FID fouling even during long-time measuring series

✔ Recommended application

- Carboxylic acids, hydroxy and ketocarboxylic acids, amino acids, amines, alcohols, polyalcohols, sugars, mercaptans and similar compounds with active hydrogen atoms. Even amine hydrochlorides can be silylated directly.

- The addition of protic solvents in submolar quantities, e.g., TFA for extremely polar compounds (hydrochlorides) or pyridine for carbohydrates, can improve the already good dissolving power of MSTFA.
- Advantages: complete conversion with high reaction rates, even without a catalyst (1–2 % TMCS or TSIM); the by-product of the reaction (*N*-methyltrifluoroacetamide) shows a high volatility and a short retention time

MSHFBA *N*-methyl-*N*-trimethylsilyl-heptafluorobutyramide

• M 299.1 g/mol,
Bp 148 °C (760 mm Hg)

★ Key features

- Similar to MSTFA in reactivity and chromatography
- Either applied alone or in combination with a catalyst (TMCS, TSIM) or another silylation reagent with or without solvent; the by-product *N*-methylheptafluorobutyric amide has a lower retention time than the silylating reagent

✔ Recommended application

- Carboxylic acids, alcohols, phenols, primary and secondary amines and amino acids

- Especially useful for flame ionization detection due to the large ratio of fluorine to silicon of 7:1, since degradation of the surplus MSHFBA does not produce SiO₂ but volatile, non-corrosive silicon compounds

MBDSTFA *N*-methyl-*N*-*tert*-butyldimethylsilyl-trifluoroacetamide

• M 241.3 g/mol,
Bp 170 °C (760 mm Hg),
Density d_{20°/4°} = 1.121

★ Key features

- Silylation reagent that donates a *tert*-butyldimethylsilyl group (TBDMS) for derivatizing active hydrogen atoms in hydroxyl, carboxyl and thiol groups as well as primary and secondary amines
- Fast reactions (typically 5–20 min) with high yields (> 96 %), by-products are neutral volatiles

- TBDMS ethers are 10⁴ times more stable than the corresponding TMS ethers
- Due to the large protecting group, chromatographic retention times are longer. This may have a beneficial impact on some separations. The high concentration of M⁺-57 ions is an interesting topic for GC/MS.

Silylation with MSTFA, MSHFBA or MBDSTFA

• Procedure see page 367 or online at www.mn-net.com/apps

MSTFA MN Appl. Nr. 213111 · MSHFBA MN Appl. Nr. 213112 · MBDSTFA MN Appl. Nr. 213113

Ultrapure derivatization reagents for acylation, alkylation and silylation.

DMCS Dimethyldichlorosilane

• M 129.06 g/mol,
Bp 70 °C (760 mm Hg),
Density d_{20°/4°} = 1.07

★ Key features

- Used to form dimethylsilyl (DMS) derivatives
- DMS derivatives are much more susceptible to hydrolysis than TMS derivatives, it is therefore vital to have strictly anhydrous conditions during the conversion.

HMDS Hexamethyldisilazane

• M 161.4 g/mol,
Bp 126 °C (760 mm Hg),
Density d_{20°/4°} = 0.7742

★ Key features

- Weak TMS donor; used as a sole reagent, it is slow and not very effective.
- Aprotic solvents like acetonitrile, pyridine, dimethylformamide, carbon disulfide and dimethylacetamide recommend themselves for use with HMDS.
- With catalytic quantities, e.g., 1 % of, or as a mixture with TMCS (2:1, v/v; SILYL-21 and SILYL-2110) it is perfectly suited for a quick and quantitative trimethylsilylation of organic compounds.

TMCS Trimethylchlorosilane

• M 108.7 g/mol,
Bp 57 °C (760 mm Hg),
Density d_{20°/4°} = 0.8580

★ Key features

- Often used as a catalyst with other trimethylsilyl reagents
- As a sole reagent, it can be used to prepare TMS derivatives of organic acids.

TSIM *N*-trimethylsilyl-imidazole

• M 140.3 g/mol,
Bp 94–96 °C (760 mm Hg),
Density d_{20°/4°} = 0.961

★ Key features

- Strongest hydroxyl silylator
- It is remarkable that TSIM reacts quickly and smooth with hydroxyl (even tert. OH) and carboxyl groups, but not with amines. Hence it is especially suited for multiple derivatizations, when compounds with various functional groups are to be derivatized in different ways (e.g., -O-TMS, -*N*-HFB derivatives of catecholamines).

✓ Recommended application

- Alcohols, phenols, organic acids, steroids, hormones, glycols, nucleotides, narcotics
- Reagent of choice for carbohydrates and most steroids (even strongly hindered steroids)

Silylation with TSIM or SILYL-1139 (TSIM – pyridine 11:39)

• Procedure see page 367 or online at www.mn-net.com/

apps

Due to their purpose, derivatization reagents are very reactive substances. For this reason, they should be stored cool and protected from moisture. For easy access with a syringe, our derivatization reagents are supplied in vials with crimp caps (exception DMCS and TMCS with screw closure). Vials with pierced sealing disks have limited stability and should be used soon.

Silylation with SILYL-21 or SILYL-2110

- Recommended applications: sugars, glycols, sterically unhindered alcohols, carboxylic acids, acids in urine, hydroxy fatty acids, nucleotides, steroids, vitamin D, xanthone derivatives
 - Procedure see page 367 or online at www.mn-net.com/apps
- SILYL-21 MN Appl. Nr. 213131
SILYL-2110 MN Appl. Nr. 213132

O-trimethylsilylation with MSTFA followed by N-trifluoroacetylation with MBTF

- Procedure see page 367 or online at www.mn-net.com/apps
- MSTFA/MBTFA MN Appl. Nr. 213140

Acylation

with fluorinated acid anhydrides · TFAA MN Appl. No. 213041 · HFBA MN Appl. No. 213042

Dissolve 0.1 to 1 mg sample in 0.1 mL solvent, add 0.1 mL of the anhydride and heat to 60–70 °C for 1–2 h. If the sample needs not be concentrated prior to the analysis and if there is no danger of catalytically induced side reactions, pyridine is used as solvent. The reaction solution can be injected directly into the gas chromatograph. Otherwise, use a volatile solvent and evaporate solvent, excess reagent and free acid in a stream of nitrogen. Dissolve residue in 50 µL hexane, chloroform etc. and inject aliquot portions.

with fluorinated acid amides · MBTFA MN Appl. No. 213051 · MBHFBA MN Appl. No. 213052

Add 0.5 mL MBTFA or MBHFBA to about 2 mg sample. If there is no reaction at ambient temperature, heat the reaction mixture to 120 °C. Compounds difficult to dissolve, can be trifluoroacetylated in suitable solvent mixtures. It is recommended to use a ratio of solvent to MBTFA or MBHFBA of 4:1. The reaction mixture is chromatographed directly.

Alkylation (Methylation)

with TMSH · MN Appl. No. 213060

Dissolve 100 mg sample (e.g., butter) in 5 mL of a solvent (e.g., *tert.*-butyl methyl ether). Add 50 µL reagent to 100 µL of this solution. The mixture is injected directly. The temperature of the injector must be at least 250 °C.

with DMF-DMA · MN Appl. No. 213070

Add 1 mL of a mixture of DMF-DMA and pyridine (1:1) to 1–50 mg fatty acids. The sample can be injected as soon as a clear solution has formed. It is recommended, however, to heat the solution to 60–100 °C for 10–15 min.

with methanol – TMCS · MN Appl. No. 213080

Add 1 mL methanol – TMCS to about 50 mg carboxylic acid or glyceride and heat. Then evaporate in a stream of nitrogen and dissolve again for injection in, e.g., *n*-heptane.

Silylation

with BSA, BSTFA oder SILYL-991 (BSTFA + 1 % TMCS)

BSA MN Appl. No. 213091 · BSTFA MN Appl. No. 213092 SILYL-991 MN Appl. No. 213093

Add 0.5 mL of the silylation reagent to 1–10 mg sample; if necessary, add some solvent (normally pyridine or DMF [dimethylformamide]). Heat to 60–80 °C for 20 min to increase the reaction rate. 1–2 drops of TMCS (trimethylchlorosilane) or TSIM will also speed up the reaction.

with BSA in combination with other silylation reagents · MN Appl. No. 213100

BSA alone silylates all sterically unhindered hydroxyl groups of the steroid skeleton; addition of TMCS will enable reaction of moderately hindered OH groups (reaction time 3–6 h at 60 °C). After addition of TSIM even strongly hindered hydroxyl groups will react (reaction time 6–24 h at 60 °C).

with MSTFA, MSHFBA or MBDSTFA

MSTFA MN Appl. No. 213111 · MSHFBA MN Appl. No. 213112 · MBDSTFA MN Appl. No. 213113

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 h and can be analyzed directly. If TFA is used as a solvent, proceed as follows [20]: dissolve 1–2 mg sample in 100 µL TFA. Dropwise add 0.9 mL of the silylating reagent. After cooling the sample can be chromatographed directly.

with TSIM or SILYL-1139 (TSIM – pyridine 11:39) · TSIM MN Appl. No. 213121 · SILYL-1139 MN Appl. No. 213122

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 hour and can be analyzed directly. Recommended solvent pyridine. When using SILYL-1139, the presence of water does not interfere.

with SILYL-21 or SILYL-2110 · SILYL-21 MN Appl. No. 213131 · SILYL-2110 MN Appl. No. 213132

Carefully add SILYL-21 or SILYL-2110 to 1–10 mg of the sample. Precipitated ammonium chloride does not interfere. If the sample should not dissolve within 5 min, heat to 75–85 °C. If no mutarotation is to be expected, you may dissolve the sugar in warm pyridine first and then add the silylation reagent. In some cases it may be advantageous to use a different solvent instead of pyridine. For derivatization of 3-ketosteroids we recommend to use DMF (dimethylformamide)

O-trimethylsilylation with MSTFA followed by *N*-trifluoroacetylation with MBTFA · MN Appl. No. 213140

Completely silylate 2 mg of the sample with 0.3 mL MSTFA, e.g., as described on page 363. After addition of 0.3 mL MBTFA the *N*-trimethylsilyl group is replaced by the *N*-trifluoroacetyl group. The mixture can be analyzed directly.

Connectors for capillary GC columns

★ Key features

- Glass connectors for fused silica capillary columns from 0.2 to 0.53 mm ID: manufactured from deactivated glass with slightly tapered inner diameter; used to join two fused silica capillaries of equal or different diameters. Advantages compared to stainless steel fittings are easy connection without tools, optical control during connection, negligible heat capacity and no dead volume.

- Graphseal ferrules for capillary columns: a stainless steel ferrule filled with graphite – the ideal sealing material for capillaries. The capillary is mounted on a 1/16" exit (detector, injector etc.), with the appropriate ferrule, a nut (with slit) and an adapter (see table below).

Ordering information

Connectors for capillary GC columns

Description	Pack of	REF
Graphseal ferrules for capillary columns		
0.4 mm bore	10 ferrules	708337
0.5 mm bore	10 ferrules	708318
0.8 mm bore	10 ferrules	708319
Universal capillary glass connectors		
linear	5 connectors	707971
linear	10 connectors	707972
Y splitter	1 connector	707973

- ① 1/16" exit
- ② Graphseal ferrule
- ③ Capillary

Tools and general accessories for GC

★ Key features

- Magnifying lens with scale: an essential tool for any laboratory. In capillary GC it is often important to inspect column integrity or check cut ends of capillaries. When closing a column by melting the magnifying lens can be used to check whether the column is really closed or whether an open channel has been formed in the sealed end. Our lens provides 8fold magnification and is supplied with a scale as pictured in the figure below. The space between lines is equivalent to 1/10 mm.
- Diamond file: a useful tool for cutting capillaries and smoothing ends of capillaries. Square capillary ends are especially important for butt connections (e.g., in Valco unions).
- Glass wool, quartz wool and glass fiber wadding are used for, e.g., GC liners, packed GC columns etc.

Ordering information

Tools and general accessories

Description	Pack of	REF	
Tools for capillary GC			
Diamond file	for cutting capillaries and straightening capillary ends	1	708300
Magnifying lens with scale	magnification 8x	1	706296
PTFE tape for sealing, reels 12 m long, 12 mm wide, 0.1 mm thick	1 reel		706512
Glass wool			
Glass wool, long fibers, DMCS treated, for packed GC columns	50 g		706201
Glass fiber wadding silanized, very fine fibers	25 g		718002
Quartz wool, very fine fibers	25 g		718587

%C	carbon content in percent	LV	large volume
Å	angstrom = 0.1 nm = 1.0×10^{-10} m	MPS	CHROMABOND® SPE cartridges for MultiPurposeSampler
ACN	acetonitrile	MS	mass spectrometry (suitable)
Alox	aluminum oxide	MTBE	methyl <i>tert</i> -butyl ether
AOX	sum parameter for adsorbable organic bounded halogens	N	e.g., N 11, identified the nominal diameter of a bottle neck, an insert, a closure or a septum
ASP	CHROMABOND® SPE cartridges for ASPEC systems	nm	nanometer = 1.0×10^{-9} m
BDS	base deactivated octadecylsilan (C ₁₈)	NP	normal phase
BET	analytical methods for determining of surfaces size (developer: Stephen Brunauer, Paul Hugh Emmett and Edward Teller)	OD	outer diameter
BTEX	aromatic hydrocarbons: benzene, toluene, ethyl benzene and xylene	ODS	octadecylsilan (C ₁₈)
BTX	sum parameter for volatile aromatic hydrocarbons	PA	polyamide, nylon
DIN	German Institute for Standardization	PAH	polycyclic aromatic hydrocarbons
DMA	dimethylamino = N(CH ₃) ₂	PCA	propylcarboxylic acid also butyric acid
DOC	dissolved organic carbon	PCB	polychlorinated biphenyls
DVB	divinylbenzene copolymer	PE	polyethylene
EC	column hardware for analytical columns in HPLC	PEEK	polyether ether ketone
ec	endcapping or endcapped	PEG	polyethylene glycol
EP	European Pharmacopoeia (Ph. Eur., PharmEurl., etc.)	PEI	polyethylenimin
EPA	US Environmental Protection Agency	PL	phospholipids
ETFE	ethylene tetrafluoroethylene	PP	polypropylene
F217	gasket material (foamed polyethylene between two solid polyethylene layers)	ppb	parts per billion (1 per 1000000000 = 10 ⁻⁹)
FEP	fluorinated ethylene propylene	ppm	parts per million (1 per 1000000 = 10 ⁻⁶)
FID	flame ionization detector	PS/DVB	polystyrene divinylbenzene copolymer
FS	fused silica	PSA	propylsulfonic acid
GC	gas chromatography	PTFE	polytetrafluoroethylene
HEPT	height equivalent to a theoretical plate	REF	reference number, article number, product number, ordering number
HILIC	hydrophylic interaction chromatography	RI	refractive index
HPLC	high performance liquid chromatography	RP	reversed phase
HPTLC	high performance thin layer chromatography	SA	strong acidic, also see SCX
HS	headspace	SAX	strong anion-exchanger
ID	internal diameter	SB	strong basic, also see SAX
IR	infrared spectroscopy, spectral range	SCX	strong cation-exchanger
ISO	International Organization for Standardization	SiOH	silanol, unmodified silica
		SPE	solid phase extraction

List of abbreviations

SPME	solid phase micro extraction
TEF	Tefzel [®] , see ETFE
TFA	trifluoroacetic acid
THC	tetrahydrocannabinol
THF	tetrahydrofuran
TLC	thin layer chromatography
TOC	total organic carbon
UHPLC	ultra HPLC, high separation performance by < 2 μ m particles or core-shell technology
UPLC	see UHPLC, but protected term of the company Waters Corporation (USA)
USP	United States Pharmacopeia
UV	ultraviolet wavelength range (e.g., 254 nm), spectral range
VOC	volatile organic compounds
VP	column hardware for preparative columns in HPLC
WCX	weak cation-exchanger

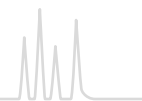

MACHEREY-NAGEL trademarks

ALUGRAM	coated aluminium sheets for TLC
CHROMABOND	columns for solid phase extraction (SPE)
CHROMAFIL	syringe filters (membrane filters)
CHROMAFIX	cartridges for solid phase extraction (SPE)
ChromCart	cartridge system for HPLC
LIPODEX	fused silica capillary columns with cyclodextrin phases for GC enantiomer separation
NUCLEODUR	spherical high purity silica for HPLC
NUCLEOGEL	polymer-based HPLC columns
NUCLEOGEN	HPLC ion exchange columns for nucleic acid analyses
NUCLEOSHELL	core-shell silica phases for HPLC
NUCLEOSIL	spherical standard silica for HPLC
OPTIMA	fused silica high performance capillary columns with immobilized phases
OPTIMA WAXplus	fused silica high performance capillary columns with optimized polyethylene glycol phase
PERMABOND	fused silica capillary columns with immobilized phases
POLYGOSIL	irregular silica for HPLC
POLYGRAM	coated polyester sheets for TLC

Disclaimer

All used names and denotations can be brands, trademarks or registered labels of their respective owner – also if they do not have a special denotation. To mention products and brands is only a kind of information, i.e. it does not offend against trademarks and brands and can not be seen as a kind of recommendation or assessment.

Regarding these products or services we can not grant any guarantees regarding selection, efficiency or operation.

Product use restriction

MACHEREY-NAGEL chromatography products are intended, developed, designed and sold for research and development purposes and analytical quality control / routine measurements only, except, however, any other function of the product being expressly set forth in original MACHEREY-NAGEL product leaflets.

MACHEREY-NAGEL products are intended for general laboratory use only!

MACHEREY-NAGEL products are suited for qualified personnel only!

MACHEREY-NAGEL products shall in any event be used wearing adequate protective clothing.

For detailed information please refer to the respective Material Safety Data Sheet of the product!

MACHEREY-NAGEL products shall exclusively be used in an adequate test environment.

MACHEREY-NAGEL does not assume any responsibility for damages due to improper application, abuse, misuse, storage or maintenance of our products. Prior to application the user has to read carefully and understand the instruction or product leaflets included in the product package (if applicable or available on the webpage) - in case of any doubts the customer has to contact MACHEREY-NAGEL.

Application on the human body is STRICTLY FORBIDDEN. The respective user is liable for any and all damages resulting from such application.

The user has to ensure that the products used are suitable for the intended application.

MACHEREY-NAGEL does not warrant the reproducibility of published applications.

MACHERY-NAGEL

Chromatography

ALUGRAM[®] Xtra

State of the Art TLC Aluminium Sheets

*NEW
now with
nano silica and
concentrating zone*

200 μm

**outstanding wettability
easy and reliable
excellent separation efficiency**

MACHERY-NAGEL

www.mn-net.com

Since 1911

ALUGRAM® Xtra SIL G · aluminium sheets unmodified standard silica layers on aluminium for TLC

- outstanding wettability for precise colorization results, even with 100 % aqueous eluents
- excellent separation efficiency and reproducibility from lot to lot
- easy and reliable cutting due to an optimized binder system, no flaking of silica

Silica 60, specific surface (BET) ~ 500 m²/g, mean pore size 60 Å, specific pore volume 0.75 mL/g, **particle size 5–17 µm**

Indicator: manganese activated zinc silicate with green fluorescence for short-wave UV (254 nm); special inorganic fluorescent pigment with blue fluorescence for long-wave UV (366 nm)

Binder: highly polymeric product, which is stable in almost all organic solvents and resistant towards aggressive visualization reagents; binder system for ALUGRAM® Xtra is also completely stable in purely aqueous eluents.

Separation of nutmeg ingredients

Sample solution: shake 1.0 g freshly powdered drug for 3 min with 4 mL methanol and filter; apply 10 µL
 Layer: ALUGRAM® Xtra SIL G UV₂₅₄
 Eluent: toluene – ethyl acetate (95:5, v/v)
 Migration distance: 15 cm
 Detection: 254 nm: underivatized
 daylight and 366 nm: spray with 5 % ethanolic sulphuric acid, 1 % vanillic acid and heat to 105 °C

MN Appl. No. 403590

The chromatograms show the following zones with increasing R_f values: linalool (bluish grey), eugenol (yellowish brown), myristicin (reddish brown), and anethole (pink-violet). Other colored zones may appear.

Separation of saffron ingredients

Sample solution: stir 10 mg drug with 50 µL water in a small glass reaction tube. After 3 minutes add 1 mL methanol and store the solution for 20 minutes in the dark. Afterwards filter through a CHROMAFIL®Xtra GF-100/25 filter; apply 10 µL

Layer: ALUGRAM® Xtra SIL G UV₂₅₄
 Eluent: ethyl acetate – 2-propanol – water (65:25:10, v/v/v)
 Migration distance: 10 cm
 Detection: the sheet is dried with a hair dryer and analyzed under daylight, UV 254 nm and 366 nm.

The chromatograms show as main compound Naphtol yellow S. Other colored zones may appear.

MN Appl. No. 403600

NEW

ALUGRAM® Xtra SILGUR · aluminium sheets standard silica layers with concentrating zone for TLC

- 🔸 **concentrating zone:** valuable aid for manual application and time saving
- 🔸 **excellent separation efficiency**
- 🔸 **easy cutting and outstanding wettability**

Silica 60, specific surface (BET) ~ 500 m²/g, mean pore size 60 Å, specific pore volume 0.75 mL/g, **particle size 5–17 µm**

Kieselguhr zone for rapid sample application: because kieselguhr is completely inert towards a large number of compounds, the samples always form a narrow band at the interface of the two adsorbents, irrespective of shape, size or position of the spots in the concentrating zone (see figure). Separation then takes place in the silica layer.

Ordering information

ALUGRAM® Xtra · aluminium sheets standard silica layers with concentrating zone

SILGUR	818412	818413	0.20 mm	–
SILGUR UV ₂₅₄	818422	818423	0.20 mm	UV ₂₅₄

Save your precious time!

A valuable aid for manual application especially of large volumes of very dilute samples is the concentrating zone ①, which consists of a chromatography inactive adsorbent (kieselguhr). The substances to be separated are concentrated to a narrow band in the concentrating zone ③. The separation starts at the beginning of the chromatographically active adsorbent silica ④.

Concentrating zone as “rapid application zone” - quantitative evaluation of chromatograms is possible, even if samples applied irregular ②. TLC layers with concentrating zone facilitate the handling and also save time in analysis.

NEW

ALUGRAM® Xtra Nano-SIL G · aluminium sheets nano silica layers for HPTLC

- sharper separations in shorter development time and shorter migration distances
- smaller samples and an increased detection sensitivity
- easy cutting and outstanding wettability

A guide to derivatization reagents for GC

Regarding derivatization

Derivatization is one of the most common ways to prepare compounds for GC that are otherwise difficult to separate. Through derivatization, it is possible to improve the separation by replacing active hydrogens from the analyte with various groups that are easier to handle. Derivatization generally improves the following GC parameters:

- Chromatographic behavior
- Peak shape
- Thermal and chemical stability
- Detectability
- Volatility

It is also important that all the instruments, e.g., laboratory glassware, will not interfere with the sample.

To make sure that no compounds containing -OH, -SH or -NH groups will be adsorbed by present Si-OH on the surface of the glass, a deactivation process may be necessary.

This is commonly achieved by rinsing the glass with a silylating agent, e.g., **DMCS** or **HMDS**, hence masking all silanols with non adsorptive methyl groups.

To achieve a satisfying rate of derivatization, it is essential to keep the following requirements in mind:

- The derivatization reaction needs to be complete $\approx 100\%$
- No loss of sample during derivatization
- The overall structure of the analyte will not be altered
- Produced derivative will be stable over time
- No interaction between the reagent and the chromatographic system

A guide to derivatization reagents for GC

Naturally, all other components of the sample preparation and handling process need to be contaminant-free and in top condition. Since water is, in most cases, a problem, it has to be removed from the derivatization process, e.g., by adding Na_2SO_4 to the reaction mixture. Like all reactions, derivatization takes time and a certain amount of heat to go to completion. As duration may vary greatly, dependent on the reactivity of the analyte, it is often necessary to screen several reagents for the best result. It is also important to realize that there is no such thing as the best derivatization method. There will always be several working solutions to a chromatographic problem with its own advantages and drawbacks, dependent on the equipment or on the approach of the chemist.

Derivatization reagents

There are many reagents in use today for derivatization. There are three categories they can be allocated to:

- Silylation
- Acylation
- Alkylation (Methylation)

Good to know

- Our derivatization reagents meet the highest demands of purity.

Silylation

Silylation is the most versatile method of derivatization in GC, i.e. more than 80 % of all derivatization reactions are actually silylations. Usually the term silylation in GC stands for replacement of active hydrogen atoms by a trimethylsilyl group (TMS derivative). Sometimes, however, trialkylsilyl groups or dimethylalkylsilyl groups with longer alkyl chains are used for derivatization. The trialkylsilyl group increases volatility and enhances thermal stability of the sample.

As with methylation, the replacement of an active hydrogen with a silyl group reduces the polarity of the compound, as well as hydrogen bonding.

Additionally, silylation improves volatility, so that many compounds that are normally considered nonvolatile or thermally unstable, can be chromatographed easily. Introducing a silyl group may also enhance the GC-MS properties of the derivative, either through characteristic ions or more favorable diagnostic patterns for structure investigations.

Good to know

- It is important to mention that silylated compounds should not be used with WAX or FFAP phases, as the OH groups of the stationary phase will definitely become derivatized by the silylating reagent, and this will irreversibly change selectivity of the column.

Silylation can be catalyzed either acidically by the addition of **TMCS** or basically by the addition of pyridine or **TSIM** (e.g., for sterically hindered molecules, such as tertiary alcohols).

Amides

N,O-bis-trimethylsilyl-acetamide (BSA)

M: 203.4 g/mol

Bp: 71–73 °C (35 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 0.83$

BSA is a strong silylation reagent that forms very stable TMS derivatives with a large variety of compounds, e.g., non-sterically hindered alcohols, carboxylic acids, phenols, enols, steroids, (biogenic) amines and alkaloids.

Not recommended for use with carbohydrates or very low molecular weight compounds.

Good solvent for polar compounds, but frequently used in combination with a solvent (pyridine, DMF etc.), with other silylation reagents or catalysts such as TFA, HCl or TMBS.

Used in combination with DMF, **BSA** is the reagent of choice for derivatizing phenols.

N,O-bis-trimethylsilyl-trifluoroacetamide (BSTFA)

M: 257.4 g/mol

Bp: 40 °C (12 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 0.96$

BSTFA is a powerful trimethylsilyl donor with approximately the same donor strength as the nonfluorinated analog **BSA**.

Advantage of BSTFA over BSA

Greater volatility of its derivatives (particularly useful for GC of some lower boiling TMS amino acids). **BSTFA** will generally react with all organic material present, but may not react with some amides, secondary amines and hindered hydroxyl groups. However, adding 1% **TMCS (SILYL-991)** will solve that problem.

Silylation

N-methyl-*N*-trimethylsilyl-trifluoroacetamide (MSTFA)

M: 199.1 g/mol
Bp: 70 °C (75 mm Hg)
density d₂₀^{°/4} = 1.11

MSTFA is the most volatile trimethylsilyl amide available.

MSTFA is a very strong TMS donor that does not cause any noticeable FID contamination even after long-time measuring series. It is one of the most important silylating reagents. It can be used, to silylate the hydrochloride salts of amines or amino acids directly.

The already good solution characteristics can be improved by adding submolar quantities of protic solvents (e.g., TFA for extremely polar compounds such as hydrochlorides) or pyridine (e.g., for carbohydrates).

Advantages

- Complete reaction with high reaction rates, even without a catalyst (1–2 % TMCS or TSM)
- By-product of the reaction (*N*-methyltrifluoroacetamide) features high volatility and short retention time.

Reactivity of silylation reagents (acc. to M. Donike)

TMS amides (e.g., BSA, MSTFA) >
TMS amine = TSM > Enol-O-TMS ether >
S-TMS ether > O-TMS ether > TMS-O-TMS

Stability of the TMS derivatives

O-TMS ether > S-TMS ether > Enol-O-TMS
ether > TMS amine > TMS amide

Silylation

N-methyl-*N*-trimethylsilyl-heptafluorobutyramide (MSHFBA)

M: 299.1 g/mol

Bp: 148 °C (760 mm Hg)

MSHFBA is similar to MSTFA in reactivity and chromatography.

Used either alone or in combination with a catalyst (TMCS, TSIM) or another silylation reagent with or without solvent.

By-product *N*-methylheptafluorobutyric amide has a lower retention time than the silylating reagent.

Especially useful for FID, because, due to the large 7:1 ratio of fluorine to silicon, the degradation of excess MSHFBA does not produce SiO₂ but volatile, non-corrosive silicon compounds.

N-methyl-*N*-tert-butyl(dimethylsilyl)-trifluoroacetamide (MBDSTFA)

M: 241.3 g/mol

Bp: 168–170 °C (760 mm Hg)

density d₂₀ °/4 ° = 1.12

MBDSTFA is a silylation reagent that donates a tert-butyl(dimethylsilyl) group (TBDMS) for derivatizing active hydrogens in hydroxyl, carboxyl and thiol groups, primary and secondary amines, as well as in amino acids.

Fast reactions (typically 5–20 min) with high yields (> 96 %). By-products are neutral and volatile.

TBDMS ethers are 10⁴ times more stable than the corresponding TMS ethers. Chromatographic retention times are longer due to the large protecting group, which may improve some separations.

Very useful for GC-MS applications, because of a high molecular ion concentration at M⁺-57 applications.

Silanes / silazanes

Dimethyldichlorosilane (DMCS)

M: 129.06 g/mol

Bp: 70 °C (760 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 1.07$

DMCS is used to form dimethylsilyl (DMS) derivatives.

DMS derivatives are much more susceptible to hydrolysis than TMS derivatives. Therefore, strictly anhydrous conditions during the reaction are very important.

Hexamethyldisilazane (HMDS)

M: 161.4 g/mol

Bp: 126 °C (760 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 0.77$

HMDS is a weak TMS donor. If used as sole reagent, it is slow and not very effective. After addition of catalytic quantities (e.g., 1 %) of **TMCS** or as a mixture with **TMCS**, it is a fast and quantitative reagent for trimethylsilylation of organic compounds.

Aprotic solvents, e.g., acetonitrile, pyridine, dimethylformamide, carbon disulfide and dimethylacetamide are recommended for use with **HMDS**.

Trimethylchlorosilane (TMCS)

M: 108.7 g/mol

Bp: 57 °C (760 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 0.86$

TMCS is often used as a catalyst with other trimethylsilyl reagents. Without additives it can be used for preparing TMS derivatives of organic acids.

Together with methanol, **TMCS** can be used for Methylation.

Silylation reagent mixtures

SILYL-271 BSA – HMDS – TSIM (2:7:1)

SILYL-271 will derivatize all hydroxyl groups in any position. Useful in multidervatization schemes involving hydroxyl or amine groups.

SILYL-1139 TSIM – pyridine (11:39)

Recommended application: alcohols, phenols, organic acids, steroids, hormones, glycols, nucleotides and narcotics.

SILYL-21 HMDS – TMCS (2:1)

SILYL-21 will derivatize amides and many secondary amines and hindered hydroxyls that would not be completely derivatized by HMDS alone. It can be used without solvent.

SILYL-2110 HMDS – TMCS – pyridine (2:1:10)

SILYL-319 HMDS – TMCS – pyridine (3:1:9)

SILYL-2110 and SILYL-319 will derivatize alcohols, bile acids, phenols, most steroids, sterols, and sugars that would not be completely derivatized by HMDS alone. SILYL-2110 and SILYL-319 are fast and easy to use, and can be used without solvent.

SILYL-991 BSTFA – TMCS (99:1)

BSTFA is a powerful trimethylsilyl donor. For silylating of fatty acid amides, hindered hydroxyls and other compounds that are difficult to silylate, e.g., secondary alcohols and amines, we recommend BSTFA + 1 % TMCS, available under the designation SILYL-991.

Good to know

- Most derivatives are susceptible to water and hydrolysis
- Reactions only in aprotic solvents possible
- The presence of water does not interfere with SILYL-1139.

Imidazoles

N-Trimethylsilyl-imidazole (TSIM)

M: 140.3 g/mol

Bp: 94–96 °C (760 mm Hg)

density d₂₀ °/4 ° = 0.96

TSIM is the strongest hydroxyl silylator, the reagent of choice for carbohydrates and most steroids (even highly hindered steroids).

The reagent is unique in that it reacts quickly and smooth with hydroxyl (even tert. OH) and carboxyl groups, but not with amines. This characteristic makes TSIM particularly useful in multi-derivatization schemes for compounds with different functional groups that are to be derivatized differently, e.g., -O-TMS/-N-HFB derivatives of catecholamines.

Summary silylation

- Silylation can be applied on many compounds
- Silylating reagents are easily prepared
- Large variety of reagents available

Acylation / Benzoylation

Generally, acylation involves the introduction of an acyl group into a molecule with a replaceable hydrogen, or across a double bond. Acylation is used to convert compounds like alcohols, amines and thiols into their respective esters, amides and thioesters. Additionally, they enhance the detectability of the compounds by adding halogenated carbon to the compounds. This is achieved through the reaction with fluorinated acyl halides, anhydrides or bisacylamides. While the corresponding acidic by-products of the reactions with acyl halides and anhydrides need to be removed from the system by a suited base, e.g., pyridine, to prevent column damage. By-products of bisacylamides are not acidic and normally do not interfere with the subsequent analysis. Hence, they are favorable reagents for acylations.

Acyl halides

Pentafluorobenzoyl chloride (PFBC)

R= C₆F₅, X=Cl

M: 230.52 g/mol

Bp: 158–159 °C (760 mm Hg)

density d₂₀^{°/4} = 1.60

PFBC will react with hydroxyls, primary and secondary amines, amides and thiols.

Anhydrides

Trifluoroacetic acid anhydride (TFAA)

R=CF₃

M: 210.04 g/mol

Bp: 39.5–40.5 °C (760 mm Hg)

density d₂₀^{°/4} = 1.49

Heptafluorobutyric acid anhydride (HFBA)

R=C₃F₇

M: 410.06 g/mol

Bp: 106–107 °C (760 mm Hg)

density d₂₀^{°/4} = 1.665

Acylation with fluorinated acid anhydrides can be used for alcohols, phenols, carboxylic acids, amines, amino acids and steroids forming volatile, stable derivatives suited for FID as well as for ECD detection.

Bisacylamides

N-methyl-bis(trifluoroacetamide) (MBTFA)

M: 223.08 g/mol

Bp: 123–124 °C (760 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 1.55$

N-methyl-bis(heptafluorobutyramide) (MBHFBA)

M: 423.1 g/mol

Bp: 165–166 °C (760 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 1.67$

Acylation with fluorinated acid amides is recommended for alcohols, primary and secondary amines as well as for thiols under mild, neutral conditions. **MBTFA** also forms very volatile derivatives with carbohydrates.

Good to know

- Acylation reagents are moisture sensitive
- Reaction products (acidic by-products) often have to be removed before analysis

Summary acylation

- Addition of halogenated carbons enhances detectability by ECD
- Derivatives are hydrolytically stable
- Increased sensitivity by adding molecular weight

Alkylation

Alkylation (methylation)/ esterification

Alkylation is a derivatization method used to replace an acidic hydrogen with an alkyl or methyl group. It is generally restricted to amines or hydroxy groups like in amino or carboxylic acids. The resulting derivatives are ethers, esters, methylamines or -amides and less polar than the original compounds. Therefore, less hydrogen bonding occurs. The acidity of the hydrogen to be replaced significantly determines the conditions needed to perform the alkylation. The less acidic, the more vigorous the conditions.

Methylation reagents

Dialkylacetals

N,N-dimethylformamide dimethylacetal
(DMF-DMA)

M: 119.17 g/mol

Bp: 106–107 °C (760 mm Hg)

density $d_{20}^{20} / 4^{\circ} = 0.89$

DMF-DMA is recommended for sterically hindered carboxylic acids, aldehydes, phenols and amines.

Trimethylsulfonium compounds

Trimethylsulfonium hydroxide (TMSH, 0.2 M
in methanol)

M: 94.06 g/mol

Methylation with TMSH is recommended for free acids, chlorophenoxy-carboxylic acids, their salts and derivatives as well as for phenols and chlorophenols. Lipids or triglycerides can be converted to the corresponding fatty acid methyl esters (FAMES) by a simple transesterification.

This reaction is very elegant and convenient, because it is just necessary to add the reagent (0.2 M in methanol) to the sample solution. Removal of excess reagent is not required, since in the injector of the gas chromatograph, at 250 °C, pyrolysis to volatile methanol and dimethylsulfide will occur. Due to the high reactivity, complete derivatization is often obtained at ambient temperature. However, heating (e.g., 10 min at 100 °C) in a closed sample vial may be necessary to complete the reaction.

Alkylation

Esterification reagents

Methylation with methanol / TMCS

An 1M solution of **TMCS** in methanol is suited for the esterification of free carboxylic acids and transesterification of glycerides. Formation of HCl catalyzes the reaction. **TMCS** and silyl ether remove water and thus drive the reaction to completion. The mixture should be freshly prepared.

Summary alkylation (methylation)

- Methylation derivatives are generally stable
- Wide range of reaction conditions (from strongly acidic to strongly basic)
- Some reactions can be achieved with water present

Good to know

- Reactions are limited to acidic hydrogens or amines
- Reaction conditions may be extreme

Derivatization procedures

Silylation

with BSA, BSTFA or SILYL-991 (BSTFA + 1 % TMCS)
BSA MN Appl. No. 213091 · BSTFA MN Appl. No. 213092 · SILYL-991
MN Appl. No. 213093

Add 0.5 mL of the silylation reagent to 1–10 mg sample; if necessary, add some solvent (normally pyridine or DMF [dimethylformamide]). Heat to 60–80 °C for 20 min to increase the reaction rate. 1–2 drops of **TMCS** (trimethylchlorosilane) or **TSIM** will also speed up the reaction.

with BSA in combination with other silylation reagents · MN Appl. No. 213100

BSA alone silylates all sterically unhindered hydroxyl groups of the steroid skeleton; addition of **TMCS** will enable reaction of moderately hindered OH groups (reaction time 3–6 h at 60 °C). After addition of **TSIM** even strongly hindered hydroxyl groups will react (reaction time 6–24 h at 60 °C).

with MSTFA, MSHFBA or MBDSTFA
MSTFA MN Appl. No. 213111 · MSHFBA MN Appl. No. 213112 · MBDSTFA
MN Appl. No. 213113

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 h and can be analyzed directly. If TFA is used as a solvent, proceed as follows [20]: dissolve 1–2 mg sample in 100 µL TFA. Dropwise add 0.9 mL of the silylating reagent. After cooling the sample can be chromatographed directly.

with TSIM or SILYL-1139 (TSIM – pyridine 11:39)
TSIM MN Appl. No. 213121 SILYL-1139 MN Appl. No. 213122

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 hour and can be analyzed directly. Recommended solvent is pyridine. When using SILYL-1139, the presence of water does not interfere.

Derivatization procedures

Silylation

with SILYL-21 or SILYL-2110 or SILYL-319 · SILYL-21 MN Appl. No. 213131 · SILYL-2110 · MN Appl. No. 213132

Carefully add **SILYL-21**, **SILYL-2110** or **SILYL-319** to 1–10 mg of the sample. Precipitated ammonium chloride does not interfere. If the sample should not dissolve within 5 min, heat to 75–85 °C. If no mutarotation is to be expected, you may dissolve the sugar in warm pyridine first and then add the silylation reagent. In some cases it may be advantageous to use a different solvent instead of pyridine. For derivatization of 3-ketosteroids we recommend to use DMF (dimethylformamide).

O-trimethylsilylation with MSTFA followed by N-trifluoroacetylation with MBTFA
MN Appl. No. 213140

Completely silylate 2 mg of the sample with 0.3 mL **MSTFA**. After addition of 0.3 mL **MBTFA** the *N*-trimethylsilyl group is replaced by the *N*-trifluoroacetyl group. The mixture can be analyzed directly.

Derivatization procedures

Acylation

with fluorinated acid anhydrides

TFAA MN Appl. No. 213041 · HFBA MN Appl. No. 213042

Dissolve 0.1 to 1 mg sample in 0.1 mL solvent, add 0.1 mL of the anhydride and heat to 60–70 °C for 1–2 h. If the sample needs not be concentrated prior to the analysis and if there is no danger of catalytically induced side reactions, pyridine is used as solvent. The reaction solution can be injected directly into the gas chromatograph. Otherwise, use a volatile solvent and evaporate solvent, excess reagent and free acid in a stream of nitrogen. Dissolve residue in 50 µL hexane, chloroform etc. and inject aliquot portions.

with fluorinated acid amides

MBTFA MN Appl. No. 213051 · MBHFBA MN Appl. No. 213052

Add 0.5 mL MBTFA or MBHFBA to about 2 mg sample. If there is no reaction at ambient temperature, heat the reaction mixture to 120 °C. Compounds difficult to dissolve, can be trifluoroacetylated in suitable solvent mixtures. It is recommended to use a ratio of solvent to MBTFA or MBHFBA of 4:1. The reaction mixture is chromatographed directly.

Derivatization procedures

Alkylation (Methylation)

with TMSH · MN Appl. No. 213060

Dissolve 100 mg sample (e.g., butter) in 5 mL of a solvent (e.g., tert.-butyl methyl ether). Add 50 μL reagent to 100 μL of this solution. The mixture is injected directly. The temperature of the injector must be at least 250 °C.

with DMF-DMA · MN Appl. No. 213070

Add 1 mL of a mixture of DMF-DMA and pyridine (1:1) to 1–50 mg fatty acids. The sample can be injected as soon as a clear solution has formed. It is recommended, however, to heat the solution to 60–100 °C for 10–15 min.

with methanol – TMCS · MN Appl. No. 213080

Add 1 mL methanol – TMCS to about 50 mg carboxylic acid or glyceride and heat. Then evaporate in a stream of nitrogen and dissolve again for injection in, e.g., *n*-heptane.

Overview of important functional groups

Functional Group	Silylation*	Acylation / Benzoylation	Alkylation
Primary alcohols	BSA, MSTFA, MSHFBA, TSIM, SILYL-2110, SILYL-319, SILYL-21, SILYL-1139	TFAA, HFBA, MBTFA, MBHFBA, PFBC	TMSH
Secondary alcohols	BSA, MSTFA, MSHFBA, TSIM, SILYL-2110, SILYL-319, SILYL-21, SILYL-1139	TFAA, HFBA, MBTFA, MBHFBA, PFBC	TMSH
Tertiary (and sterically hindered) alcohols	TSIM, BSTFA, SILYL-991	TFAA, HFBA, PFBC

Due to their purpose, derivatization reagents are very reactive chemicals. For this reason, they should be stored cool and protected from moisture. For easy access with a syringe, our derivatization reagents are supplied in vials with crimp caps. Vials with pierced sealing disks have limited stability and should be used up soon.

The GC system

Configuration of a gas chromatograph

- ① Gas supply: carrier gas and - if necessary - detector gases e.g., for FID detector
- ② Sample injector: During direct injection, the sample is applied to the column without touching any other parts made from glass or metal (on-column injection). During indirect injection, the sample is brought into an evaporator and is then transferred onto the column either completely, or partially (split technique). Both techniques allow working at low temperatures, high temperatures and the use of temperature programming.
- ③ Capillary column: the heart of the GC system
- ④ Temperature-controlled oven
- ⑤ Detector: indicates a substance by generating an electrical signal (response). Some detectors are specific for certain classes of substances or for certain elements (e.g., P, N).
- ⑥ Data station for configuration of a gas chromatograph

The separation process

Chromatographic separation is achieved through continuous distribution of each sample component between the mobile and the stationary phase:

In GC, the mobile phase is always a gas, mostly either He, N₂ or H₂.

The stationary phase is often a viscous, gum-like liquid adhered to the inner wall of a capillary column (WCOT = Wall Coated Open Tubular).

Transport of the components occurs exclusively in the mobile phase, while separation only takes place in the stationary phase. The quality of a separation (resolution) depends on the residence time of the components within the stationary phase and on the rate of interactions. The type of interaction between component and phase (selectivity) is determined by the functional groups of the stationary phase. The polarity of the phase is a function of its substituents.

The chromatogram

A chromatogram consists of a base line and a number of peaks. The area of a peak allows quantitative determinations:

A: starting point of a chromatogram = time of injection of a dissolved solute

A component can be identified by its retention time (qualitative determination):

$$t_{RI} = t_0 + t'_{RI}$$

t_0 : dead time = residence time of a solute in the mobile phase (time required by a component to migrate through the chromatographic system without any interaction with the stationary phase)

t_{RI} : retention time = time interval between peak *i* and the point of injection

t'_{RI} : net retention time = difference between total retention time and dead time t_0 . It indicates how long a substance stays in the stationary phase.

Other terms characterizing a separation:

k' : retention factor: a measure for the position of a sample peak in the chromatogram. The retention factor is specific for a given compound and constant under constant conditions.

$$k'_i = \frac{t_{RI} - t_0}{t_0}$$

α : relative retention, also called separation factor or selectivity coefficient, is the ratio of two capacity factors. The reference substance is always in the denominator.

$$\alpha = \frac{k'_2}{k'_1}$$

The relative retention does not provide any information on the quality of a separation. For equal values of α two very broad peaks may overlap (as shown in a), or may be completely resolved (as in b), if they are accordingly narrow.

R: resolution: a measure for the quality of a separation, taking ($w_{1/2}$) into account according to:

$$R = 1.18 \cdot \frac{t_{R2} - t_{R1}}{(w_{1/2})_2 + (w_{1/2})_1}$$

N: number of theoretical plates: characterizes the quality of a column (should be determined for $k' > 5$). The height equivalent to a theoretical plate (h, HETP) is calculated by dividing the length L of the column by the number of theoretical plates Nth. The smaller this value the more efficient the column.

$$N = 5.54 \cdot \frac{(t_{R1})}{(w_{1/2})} \quad h = \text{HETP} = \frac{L}{N}$$

The Golay equation shows how the plate height h depends on the flow velocity u:

B: molecular axial diffusion; B is a function of the diffusion coefficient of the component in the respective carrier gas

C: resistance to mass transfer

In practice often higher velocities than $u_{opt.}$ are chosen, if separation efficiency is sufficient. Higher carrier velocities mean shorter retention times.

Parameters characterizing a capillary column

OPTIMA® 5	1.0 µm film	30 m x	0.32 mm ID
A	B	C	D

A. Stationary phase

Different chemical structures of stationary phases are responsible for the type of interaction (selectivity) between the phase and the analytes. The stationary phase also limits the temperature range for chromatography. For a detailed summary of MN phases for GC please see the following chapter.

B. Film thickness

MACHEREY-NAGEL offers ranges from 0.1 to 5.0 µm. The standard film thickness is 0.25 µm. Thin films (0.1–0.2 µm) are very well suited for high-boiling, temperature-sensitive or almost contemporaneously eluting substances.

Increasing the film thickness will increase the capacity, the retention for low-boiling substances and the inertness of the column. This is especially helpful for samples with a broad range of concentrations, or the separation of volatile polar substances.

A better coverage of the column wall by a thicker film and a reduced column surface due to a shorter column have a positive impact on the separation of very active substrates, that may cause noticeable tailing when they come in contact with non-coated spots of the column wall.

Thick films, however, always mean more stationary phase in the column, hence increased column bleeding. Therefore, maximum operating temperatures for thick-film columns are reduced. In addition, thick-film columns may have a lesser separating capacity.

C. Column length

The separating efficiency (better the number of plates N) of a column is directly proportional to its length. Most routine separations are carried out on 25 or 30 m columns, while more complex samples may require 50 or 60 m. 10 m columns are common for Fast GC (see page 340).

D. Inner diameter (ID)

The lower the ID, the higher is the theoretically possible number of plates per meter.

0.1–0.2 mm ID:

for high resolution and short retention times at low carrier gas flow

0.25 mm ID:

for analysis of complex mixtures

0.32 mm ID:

for routine analysis with short retention times, but increased capacity

0.53 mm ID:

for rapid separations with inert surface and highest capacity

Scope of delivery

Each column is individually tested and supplied with test certificate and test chromatogram, but without fittings or ferrules. Columns have fused ends or are sealed with septa, to protect them from atmospheric oxygen. Further more an instruction leaflet is enclosed.

GC cages

The standard size of a GC cage is 7 inches. On request, all columns can be supplied on a 5 inch (13 cm) cage e.g., for the Agilent GC 6850. To order, please add an E at the end of the REF number (e.g., 726470.30E)

7 inches standard size e.g., REF 726600.30

5 inches special cage e.g., REF 726600.30E

Integrated guard column

To prolong column life, even at highly contaminated or matrix-containing samples, MN offers the option to add an integrated guard column. All capillary columns are available with a 10 m guard column with respective deactivation. To order, please add V1 at the end of the REF number (e.g., 726600.30V1). Guard column combinations with other lengths, IDs or different deactivation are available on request.

Without integrated guard column e.g., REF 726600.30

With integrated guard column e.g., REF 726600.30V1

MACHEREY-NAGEL derivatization reagents

Purpose of derivatization

- Improved volatility, better thermal stability or a lower limit of detection in gas chromatography
- Prerequisite: quantitative, rapid and reproducible formation of only one derivative
- Halogen atoms inserted by derivatization (e.g., trifluoroacetates) for specific detection (ECD) with the advantage of high sensitivity
- Influence of elution orders and fragmentation patterns in MS by a specific derivatization
- We provide reagents for
 - Silylation
 - Alkylation (methylation)
 - Acylation
- For 1 x 10 mL, 1 x 50 mL and 6 x 50 mL also as screw neck vial
- Product range from page 357 onwards

0.25 µm film, 30 m x 0.25 mm ID
 Sample: MN OPTIMA® test mixture (REF 722316)
 Injection: 1.0 µL, split 15 mL/min
 Carrier gas: 0.80 bar He
 Temperature: 80 °C T_{max} (isothermal), 8 °C/min (20 min T_{max})
 Detector: FID 260–280 °C

Summary of MN phases for GC

Overview of OPTIMA® MN phases

Phase	Composition	Page	Relative polarity ^①	Maximum temperature ^②
OPTIMA® 1		310		
OPTIMA® 1 MS	100 % dimethylpolysiloxane	312		340 / 360 °C
OPTIMA® 1 MS Accent		312		
OPTIMA® 5	5 % phenyl – 95 % methylpolysiloxane	314		340 / 360 °C
OPTIMA® 5 MS	5 % diphenyl – 95 % dimethylpolysiloxane	315		340 / 360 °C
OPTIMA® 5 MS Accent	silarylene phase with selectivity similar to 5 % diphenyl – 95 % dimethylpolysiloxane	316		340 / 360 °C
OPTIMA® XLB	silarylene phase like above, optimized silarylene content for low bleeding	317		340 / 360 °C
OPTIMA® 5-3	phase with autoselectivity ^④	319		340 / 360 °C
OPTIMA® 5-6	phase with autoselectivity ^④	320		340 / 360 °C
OPTIMA® 1301	6 % cyanopropylphenyl – 94 % dimethylpolysiloxane	321		300 / 320 °C
OPTIMA® 1301 MS	silarylene phase with low bleeding: polarity similar to 6 % cyanopropylphenyl – 94 % dimethylpolysiloxane	322		300 / 320 °C
OPTIMA® 624	6 % cyanopropylphenyl – 94 % dimethylpolysiloxane	323		
OPTIMA® 624 LB	like above, phase with low bleeding	323		280 / 300 °C
OPTIMA® 1701	14 % cyanopropylphenyl – 86 % dimethylpolysiloxane	324		
OPTIMA® 1701 MS	silarylene phase with low bleeding: polarity similar to 14 % cyanopropylphenyl – 86 % dimethylpolysiloxane	325		280 / 300 °C

① = nonpolar, = polar

② First temperature (long term temperature) for isothermal operation, second value for the max. temperature (short term temperature) in a temperature program. Please note that for details refer to the description of individual phases.

③ Phases which provide a similar selectivity based on chemical and physical properties ④ See description on page 318

GC columns for special separations can be found from page 339 onwards.

hat for columns with 0.53 mm ID and for columns with thicker films temperature limits are generally lower.

OPTIMA[®] · nonpolar capillary columns

OPTIMA[®] 1 100 % dimethylpolysiloxane · USP G1 / G2 / G38

★ Key features

- Nonpolar phase
- Structure see page 307

✓ Recommended application

- Separation of components according to boiling points
- Thick film columns $\geq 3 \mu\text{m}$ film are especially recommended for solvent analysis.

✍ Temperature

- Columns with 0.1–0.32 mm ID and films $< 3 \mu\text{m}$:
 T_{max} 340 °C (long-term temperature),
 T_{max} 360 °C (short-term max. temperature in a temperature program)
- 0.53 mm ID, films $< 3 \mu\text{m}$:
 T_{max} 320 and 340 °C, resp.
- Thick film columns with films $\geq 3 \mu\text{m}$:
max. temperatures 300 and 320 °C, resp.

Similar phases

- PERMABOND[®] SE-30 (see page 336), OV-1, DB-1, SE-30, HP-1, SPB[™]-1, CP-Sil 5 CB, Rtx[®]-1, 007-1, BP1, MDN-1, AT[™]-1, ZB-1, OV-101

OPTIMA[®] 1 MS Accent 100 % dimethylpolysiloxane · USP G1 / G2 / G38

★ Key features

- Selectivity identical to OPTIMA[®] 1, nonpolar phase
- Lowest column bleed
- Solvent rinsing for removal of impurities applicable
- Increased sensitivity due to an unmatched low background level
- Structure see page 307

✓ Recommended application

- Ideal for ion trap and quadrupole MS detectors
- Perfect inertness for basic compounds
- All-round phase for environmental analysis, trace analysis, EPA methods, pesticides, PCB, food and drug analysis

✍ Temperature

- T_{max} 340 °C (long-term temperature), T_{max} 360 °C (short-term max. temperature in a temperature program)

OPTIMA® · weakly polar capillary columns

OPTIMA® 5 MS Accent silarylene phase · USP G27 / G36

★ Key features

- Chemically bonded, cross-linked silarylene phase with polarity similar to a 5 % diphenyl - 95 % dimethylpolysiloxane phase
- Lowest column bleed, nonpolar phase, solvent rinsing for removal of impurities applicable
- Structure see page 307

✓ Recommended application

- Ideal for ion trap and quadrupole MS detectors
- Perfect inertness for basic compounds
- All-round phase for environmental analysis, trace analysis, EPA methods, pesticides, PCB, food and drug analysis

✍ Temperature

- T_{max} 340 °C (long-term temperature), T_{max} 360 °C (short-term max. temperature in a temperature program)
- Film thickness > 0.5 µm:
 T_{max} 320 and 340 °C, resp.

Similar phases

- DB-5, DB-5MS, HP-5MS, Ultra-2, Equity™-5, CP-Sil 8CB low bleed/MS, Rxi®-5MS, Rtx®-5SIL-MS, Rtx®-5MS, 007-5MS, BPX™5, MDN-5S, AT™-5MS, VF-5MS

Increased sensitivity due to an unmatched low background level

The bleed comparison test of OPTIMA® 5 MS Accent with a conventional 5 MS phase shows the outstanding performance of the silarylene phase.

The unmatched low background level of the OPTIMA® 5 MS Accent, which is approximately three times lower compared to a 5 MS brand column, provides significantly increased sensitivity and allows its application in trace analysis particularly of high-boiling compounds.

Background noise at 340 °C

Range of polarities covered by OPTIMA® δ phases

All stationary GC phases can be classified by their polarities. While the selectivity of common GC phases is generally determined by permanent dipole-dipole interactions, OPTIMA® δ -3 and OPTIMA® δ -6 show an additional feature. Large, polarizable groups in the polymer chain of the stationary phase enable the analyte to induce a further dipole moment that increases

with the polarity of said analyte. We call this phenomenon “Autoselectivity”, because the column adjusts itself to the polarity of the analyte. The implemented polymers consist of cross-linked polysiloxanes with a defined composition and an extremely narrow distribution of molecular weight.

OPTIMA® δ phases cover broad ranges of polarities. Compared with conventional phases, OPTIMA® δ -3 polarity ranges from approximately the nonpolar OPTIMA® 5 to the midpolar OPTIMA® 1701, while for OPTIMA® δ -6 the polarity covers a range from about the midpolar OPTIMA® 17 to the polar OPTIMA® 210.

OPTIMA® δ phases show high temperature limits (340 / 360 °C), as well as low bleed levels, which makes them ideal for the use with mass selective (MSD) or phosphorus/nitrogen detectors (PND) in the field of environmental trace analysis.

Isomeric phenols, such as chloro- and nitrophenols, are difficult to analyze with standard GC phases (e.g., OPTIMA® 5 or OPTIMA® 17) because of co-elutions. The autoselective OPTIMA® δ -3 is able to separate all 22 phenols due to stronger interactions occurring with more polar molecules, because polar analytes induce a dipole moment in the phase of the OPTIMA® δ -3 (see chromatogram page 319).

Separation characteristics of OPTIMA® δ phases

Conditions and peaks (see page 305)

Key features of OPTIMA® δ phases

- Wide range of application due to autoselectivity
- Outstanding thermal stability similar to nonpolar phases
- Low bleed levels
- Medium polar without CN groups

Ordering information about OPTIMA® δ phases can be found on page 319 and page 320.

OPTIMA[®] δ-3 polysiloxane phase with autoselectivity · USP G49

★ Key features

- Medium polar without CN groups
- Autoselectivity resulting in a polarity range from approximately the nonpolar OPTIMA[®] 5 to the midpolar OPTIMA[®] 1701 (see page 318)
- Analytes determine the polarity of the phase

✓ Recommended application

- Ideal for MSD and PND detectors

OPTIMA® · medium polar capillary columns

OPTIMA® 624 6 % cyanopropyl-phenyl – 94 % dimethylpolysiloxane · USP G43

★ Key features

- Midpolar phase
- Structure see page 307

✓ Recommended application

- Environmental analysis
- For corresponding columns with low-film thickness see OPTIMA® 1301

✍ Temperature

- T_{max} 280 °C (long-term temperature), T_{max} 300 °C (short-term max. temperature in a temperature program)

Similar phases

- HP-624, HP-VOC, DB-624, DB-VRX, SPB™-624, CP-624, Rtx®-624, Rtx®-Volatiles, 007-624, BP624, VOCOL

OPTIMA® 624 LB 6 % cyanopropyl-phenyl – 94 % dimethylpolysiloxane

★ Key features

- Midpolar phase with low bleeding
- Structure see page 307

✓ Recommended application

- Halogenated hydrocarbons, volatiles, aromatic compounds, solvents etc.

Solvents and semi-volatiles

MN Appl. No. 212520

Column: OPTIMA® 624 LB, 30 m x 0.32 mm ID, 1.8 µm film; retention gap Phe-Sil 0.5 m x 0.53 mm
 Injection: 1 µL (10 ppm per substance in acetone), cold on-column
 Carrier gas: 1.1 bar He
 Temperature: 45 °C (3 min) → 150 °C (6 °C/min) → 300 °C (18 °C/min), 20 min 300 °C
 Detector: FID 280 °C

Peaks:

OPTIMA[®] 1701 MS silarylene phase · USP G46

★ Key features

- Chemically bonded, cross-linked silarylene phase with selectivity similar to 14 % cyanopropyl-phenyl – 86 % dimethylpolysiloxane, symmetric substituted cyanopropylsilanes and integrated phenyl rings (silarylene)
- Midpolar phase with very low bleed
- Perfect deactivation
- Structure see page 307

✓ Recommended application

- Environmental analysis (e.g., PAHs, PCBs, pesticides)
- Reference column for structure identification, e.g., in combination with OPTIMA[®] 5 MS
- 100 % ion trap and quadrupole MS compatibility

✍ Temperature

- T_{max} 280 °C (long-term temperature), T_{max} 300 °C (short-term max. temperature in a temperature program)

OPTIMA[®] · medium polar capillary columns

OPTIMA[®] 35 MS silarylene phase · USP G42 / close equivalent to USP G28 / G32

★ Key features

- Chemically bonded cross-linked silarylene phase with selectivity similar to 35 % phenyl – 65 % methyl polysiloxane, midpolar phase, polymer without CN groups
- Very low column bleeding
- Structure see page 309

✓ Recommended application

- Ideal for ion trap detectors
- Optimum column for confirmation of analytical results in combination with a 1 MS or 5 MS
- All-round phase for environmental analysis, ultra trace analysis, EPA methods, pesticides, PCB, food and drug analysis

✍ Temperature

- T_{max} 360 °C (long-term temperature), T_{max} 370 °C (short-term max. temperature in a temperature program)

Similar phases

Fast GC

★ Key features

- Decreased column diameters, high heating rates and decreased column lengths for faster GC separations with high resolution efficiency
- Small inner diameters combined with very fast temperature programs can reduce the analysis time by up to 80 %
- High sensitivity detectors with small volume and very short response time, as well as very rapid data acquisition and processing
- Small inner diameters result in high column inlet pressures and a lower volume flow of the mobile phase: very fast injection of very small samples against a high pressure
- Amount of sample, which can be injected, is limited by the inner diameter and the thin film

✎ Temperature

- High heating rates place special demands on stationary phases. OPTIMA® columns meet exactly this requirement: very low bleeding, long lifetimes, even for continuous high heating rates

Comparison of a separation on a 50 m standard capillary with separation on a 10 m fast GC column
MN Appl. No. 211260

Peaks:

1. Octanol
2. Undecane
3. Dimethylaniline
4. Dodecane
5. Decylamine
6. Methyl decanoate
7. Methyl undecanoate
8. Henicosane
9. Docosane
10. Tricosane

A) Fast GC column

Column: OPTIMA® 5, 10 m x 0.1 mm ID,
0.1 µm film
Injection 1 µL, split 1:40,
Carrier gas 0.75 bar He

B) standard GC column

Column: OPTIMA® 5, 50 m x 0.25 mm ID,
0.25 µm film
Injection 1 µL, split 1:35,
Carrier gas 1.5 bar He

Both separations:

Temperature: 80 °C → 320 °C (10 min), 8 °C/min

Detector: FID

While maintaining the temperature program and halving the pressure a time saving of 30 % results with identical separation efficiency.

In addition to this standard program, all MN GC phases can be custom-made as fast GC columns

Further applications can be found online in our application database at www.mn-net.com/apps

LIPODEX® cyclodextrin phases for enantiomer separation

★ Key features

- Base material: cyclic oligosaccharides consisting of six (α -cyclodextrin), seven (β -cyclodextrin) or eight (γ -cyclodextrin) glucose units bonded through 1,4-linkages
- Regioselective alkylation and / or acylation of the hydroxyl groups leads to lipophilic phases with varying enantioselectivity, which are well suited for GC enantiomer analysis
- Important advantage: many compounds can be analyzed without derivatization (however, for certain substances enantioselectivity can be favorably influenced by formation of derivatives)

✓ Recommended application

- A large number of separations have been achieved, however, it is not possible to make a general prediction, which phase could solve a given separation task. Even for compounds with small structural differences or within homologous series the enantiodifferentiation can be quite different. The following table shows typical applications.

Note:

- Water as solvent is strictly forbidden for all cyclodextrin phases
- Dry the sample with our CHROMAFIX® Dry (Na_2SO_4) cartridges (see page 61)
- Use suitable nonpolar solvent

Phase	Cyclodextrin derivate	T _{max} [°C]	Recommended application
LIPODEX® A	hexakis-(2,3,6-tri-O-pentyl)- α -CD	200 / 220	carbohydrates, polyols, diols, hydroxycarboxylic acid esters, (epoxy-) alcohols, glycerol derivatives, spiroacetals, ketones, alkyl halides
LIPODEX® B	hexakis-(2,6-di-O-pentyl-3-O-acetyl)- α -CD	200 / 220	lactones, diols (cyclic carbonates), aminols, aldols (O-TFA), glycerol derivatives (cyclic carbonates)
LIPODEX® C	heptakis-(2,3,6-tri-O-pentyl)- β -CD	200 / 220	Alcohols, cyanhydrins, olefins, hydroxycarboxylic acid esters, alkyl halides
LIPODEX® D	heptakis-(2,6-di-O-pentyl-3-O-acetyl)- β -CD	200 / 220	aminols (TFA), β -amino acid esters, trans-cycloalkane-1,2-diols, trans-cycloalkane-1,2-diols, trans-cycloalkane-1,3-diols (TFA)
LIPODEX® E	octakis-(2,6-di-O-pentyl-3-O-butyl)- γ -CD	200 / 220	α -amino acids, α - and β -hydroxycarboxylic acid esters, alcohols (TFA), diols (TFA), ketones, pheromones (cyclic acetals), amines, alkyl halides, lactones
LIPODEX® G	octakis-(2,3-di-O-pentyl-6-O-methyl)- γ -CD	220 / 240	menthol isomers, ketones, alcohols, carboxylic acid esters, terpenes

OPTIMA® BioDiesel for the analysis of biodiesel (DIN EN 14214 / ASTM D 6751)

OPTIMA® BioDiesel M for analysis of methanol in accordance with DIN EN 14110

★ Key features

- The methanol content in biodiesel as specified in DIN EN 14110 must not exceed 0.2 %. The column OPTIMA® BioDiesel M allows the GC headspace analysis of the methanol content in biodiesel in the concentration range from 0.01 to 0.5 % with 2-propanol as internal standard.

✍ Temperature

- T_{\max} 340 °C (long-term temperature),
 T_{\max} 360 °C (short-term max. temperature in a temperature program)

Similar phases

- Select™ Biodiesel for Methanol, Trace TR-BioDiesel (M)

OPTIMA® BioDiesel F for analysis of FAMES in accordance with DIN EN 14103:2011

★ Key features

- The analysis of biodiesel requires separation of typical FAMES between myristic acid (C_{14}) and nervonic acid ($C_{24:1}$) methyl esters. This analysis is possible on OPTIMA® BioDiesel F in only 22 min. Additionally, linolenic acid methyl ester can be determined due to the good resolution. The extended standard DIN EN 14103:2011 also covers smaller FAMES starting from C_6 (see application 214510 on opposite page). Change of the internal standard from C_{17} to C_{19} also allows the analysis of animal fats.

✍ Temperature

- T_{\max} 240 °C (long-term temperature),
 T_{\max} 250 °C (short-term max. temperature in a temperature program)

Similar phases

- Select™ Biodiesel for FAME, Trace TR-BioDiesel (F)

OPTIMA® BioDiesel G for analysis of glycerol and glycerides in accordance with DIN EN 14105

★ Key features

- The capillary column OPTIMA® BioDiesel G allows determination of free glycerol and residues of mono-, di- and triglycerides in FAMES intended as additives for mineral oils. The procedure can be applied for FAMES from rapeseed oil, sunflower oil and soy bean oil. Glycerol as well as mono- and diglycerides are derivatized to more volatile substances by addition of MSTFA in the presence of pyridine (see page 363).

✍ Temperature

- T_{\max} 380 °C (long-term temperature),
 T_{\max} 400 °C (short-term max. temperature in a temperature program)

Similar phases

- Select™ Biodiesel for Glycerides, Trace TR-BioDiesel (G), MET-Biodiesel

Capillary columns for biodiesel analysis

Analysis of FAMES from biodiesel in accordance with DIN EN 14103:2011

MN Appl. No. 214510

Column: OPTIMA® BioDiesel F, 30 m x 0.25 mm ID
 Sample: 50 µg/mL each in dichloromethane
 Injection: 10 µL, 250 °C, split 1:20
 Carrier gas: 1.2 bar He
 Temperature: 80 °C → 250 °C (8.5 min), 20 °C/min
 Detector: FID 260 °C

Peaks:

- | | |

Capillary columns for high temperature GC

OPTIMA® 5 HT for high temperature GC · USP G27 / G36

★ Key features

- Chemically bonded, cross-linked silarylene phase with polarity similar to a 5 % diphenyl - 95 % dimethylpolysiloxane phase
- Nonpolar phase, low bleeding

Similar phases

- DB-5HT, VF-5HT, HT-5, XTI-5HT, ZB-5HT

✓ Recommended application

- Ideal for MS detectors, can be rinsed with solvents
- For simulated distillation, hydrocarbon, fuel and oil analysis, high-boiling analytes

✍ Temperature

- T_{max} 380 °C (long-term temperature), T_{max} 400 °C (short-term max. temperature in a temperature program)

Separation of motor oil / mineral oil (type A + B), rapid determination in accordance with DIN H-53 / ISO DIS

MN Appl. No. 213400

Column: OPTIMA® 5 HT, 15 m x 0.32 mm ID, 0.25 µm film
 Sample: mineral oil type A + B (hydrocarbon index kit acc. to EN ISO 9377-2) in hexane
 Injection: 1 µL, splitless, 300 °C
 Carrier gas: 0.6 bar He
 Temperature: 40 °C (5 min) → 390 °C, 50 °C/min

Capillary columns for amine separation

OPTIMA® 5 Amine special column for analysis of amines · USP G27 / G36

★ Key features

- Nonpolar phase
- Improved linearity for analysis of active components at trace levels: no amine absorptions even for aliphatic and aromatic amines at concentrations of 100 pg/peak
- Tested with the OPTIMA® Amine test mixture (REF 722317), which contains, amongst others, diethanolamine and propanol-pyridine (this test mixture is supplied with each column)

✓ Recommended application

- Especially deactivated for the analysis of polyfunctional amines such as ethanalamines, amino-functionalized diols and similar compounds, which are important base materials in industrial chemistry, and show strong tailing on standard-deactivated columns

✍ Temperature

- T_{max} 300 °C (long-term temperature), T_{max} 320 °C (short-term max. temperature in a temperature program)

Similar phases

- Rtx®-5 Amine, PTA-5

Separation of secondary and tertiary amines MN Appl. No. 210280

MACHEREY-NAGEL CHROMAFIL® syringe filters

Ideal for the filtration of GC, HPLC and UHPLC sample solutions

- Diverse membrane types and filter sizes for a variety of applications
- Optimal flow geometry because of star-shaped distribution device
- Lowest content of extractable substances
- Luer lock inlet, Luer outlet
- Prefiltration of solvents protects sensitive instrument parts and chromatography columns from solid contamination and increases their lifetime.

Find CHROMAFIL® products from page 81 onwards.

Capillary columns for hydrocarbons

PERMABOND® P-100 for analysis of petrochemical products · USP G1 / G2 / G38

★ Key features

- Extra long column with nonpolar dimethylpolysiloxane phase

✓ Recommended application

- High resolution and sufficient capacity for analysis of complex mixtures of hydrocarbons

✍ Temperature

- T_{max} 300 °C (long-term temperature), T_{max} 320 °C (short-term max. temperature in a temperature program)

PERMABOND® SE-54-HKW for volatile halogenated hydrocarbons · USP G36

✓ Recommended application

- SE-54 optimized for volatile halogenated hydrocarbons

✍ Temperature

- T_{max} 300 °C (long-term temperature), T_{max} 320 °C (short-term max. temperature in a temperature program)

For the analysis of halogenated hydrocarbons, we recommend our optimized column PERMABOND® SE-54-HKW at 25 or 50 m length with our approved polysiloxane phase SE-54.

As an alternative, or to verify analytical results, the OPTIMA® 624 has proven itself as advantageous, especially for the determination of 1,1,2-trichlorotrifluoroethane (F 113) along with dichloromethane.

Both phases are also suited for the determination of vinyl chloride as well as for the separation of cis/trans isomers of 1,2-dichloroethene. The high film thickness secures a high capacity and an outstanding resolution. For GC/MS coupling, we recommend OPTIMA® 624 LB or OPTIMA® 624 with 0.2 or 0.25 mm ID

Volatile halogenated hydrocarbons

MN Appl. No. 212480

Column: PERMABOND® SE-54-HKW, 50 m x 0.32 mm ID
 Injection: 1 µL, split ~ 1:30
 Carrier gas: 0.9 bar He
 Temperature: 35 °C (25 min) → 160 °C (5 min), 10 °C/min
 Detector: ECD 300 °C

Peaks:

1. Dichloromethane (795 ng/mL)
2. Trichloromethane (75 ng/mL)
3. 1,1,1-Trichloroethane (67 ng/mL)
4. 1,2-Dichloroethane (100 ng/mL)
5. Tetrachloromethane (15.9 ng/mL)
6. Trichloroethene (14.6 ng/mL)
7. Bromodichloromethane (20 ng/mL)
8. Dibromochloromethane (122 ng/mL)
9. Tetrachloroethene (81 ng/mL)
10. Tribromomethane (28.9 ng/mL)

Capillary columns for hydrocarbons

7. Hexamethyldisiloxane

Diethylene glycol standard in wine

MN Appl. No. 201500

Column: PERMABOND® CW 20 M-DEG,
 25 m x 0.25 mm ID
 Injection: 0.5 µL, split ~1:40
 Carrier gas: 1.2 bar N₂
 Temperature: 80 °C → 200 °C, 10 °C/min
 Detector: FID 260 °C

Peaks:

- DEG standard
1. 1,4-Butanediol
 2. Diethylene glycol
 3. Glycerol

PERMABOND® CW 20 M-DEG for determination of diethylene glycol · USP G16

★ Key features

- Polyethylene glycol 20 000 (diethylene glycol tested)

✓ Recommended application

- Determination of diethylene glycol (DEG), e.g., for the quality control of wine

✍ Temperature

- T_{max} 220 °C (long-term temperature), T_{max} 240 °C (short-term max. temperature in a temperature program)

Ordering information

PERMABOND® CW 20 M-DEG

	Length → 25 m
0.25 mm ID (0.4 mm OD)	
0.25 µm film	723063.25

0.25 mm ID (0.4 mm OD)	723105.10	723105.25
0.32 mm ID (0.5 mm OD)	723349.10	723349.25
0.53 mm ID (0.8 mm OD)	723562.10	723562.25

Untreated capillaries are supplied without cage.

For a considerably longer lifetime, even for contaminated or matrix-containing samples, MN offers the option of integrated precolumns. All capillary columns are available with a 10 m guard column with matched deactivation. For ordering, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

Retention gaps

★ Key features

- The retention gap technique in combination with on-column injection allows to concentrate a large sample volume in the capillary column.
- Choice of the retention gap depends on the solvent used: the flooded zone after injection should be between 20–30 cm/μL
- Me-Sil retention gap: only for use with *n*-hexane and diethyl ether
- Phe-Sil retention gap: for all solvents except methanol and water
- CW retention gap: for all solvents and especially for methanol and water

✎ Temperature

- T_{max} 250 °C (CW retention gaps),
- T_{max} 320 °C (Me-Sil and Phe-Sil retention gaps)

Note:

- Calculation example: length of flooded zone ~ 20–30 cm/μL, retention gap 10 m x 0.32 mm ID, capillary column: 25 m x 0.32 mm ID, max. injection volume ~ 30–50 μL
- A retention gap must be inert without any noticeable retention: Me-Sil retention gaps are more inert than Phe-Sil, while Phe-Sil is less susceptible to contamination
- Retention gaps can also be used as transfer lines or precolumns (contamination capacity about 5–10 μg).

Derivatization reagents

★ Key features

- Derivatization reagents: To improve volatility, increase thermal stability or to achieve a lower limit of detection in gas chromatography
- Prerequisite: quantitative, rapid and reproducible formation of only one derivative
- Halogen atoms inserted by derivatization, e.g., trifluoroacetates, allow the specific detection in an ECD with the advantage of high sensitivity.
- Specific derivatizations may influence elution orders and fragmentation patterns in a MS
- We provide reagents for
 - acylation
 - alkylation (methylation)
 - silylation
- For 1 x 10 mL, 1 x 50 mL and 6 x 50 mL also available with screw closure

Ordering information

	alkylation	R'-CO-O-R	DMF-DMA, MeOH/TMCS (1 M), TMSH
salts	silylation	R'-CO-O-TMS susceptible to hydrolysis	TMCS
carbohydrates	silylation		MSTFA, TSIM, HMDS, SILYL-1139
	acylation		TFAA, MBTFA
steroids	silylation		BSA, TSIM
	acylation		TFAA, MBTFA, HFBA, MBHFBA

These products contain harmful substances which must be specially labeled as hazardous. For detailed information please see SDS.

Due to their purpose, derivatization reagents are very reactive substances. For this reason, they should be stored cool and protected from moisture. For easy access with a syringe, our derivatization reagents are supplied in vials with crimp caps (exception DMCS and TMCS with screw closure). Vials with pierced sealing disks have limited stability and should be used soon.

The derivatization procedures can be found on page 367.

- Diverse tips and hints

Order now your derivatization brochure KATEN200144

Acylation reagents

Acyl halides

★ Key features

- By-product of acylation with acyl halides: corresponding hydrohalic acids excess of reagent and acid have to be removed or trapped by a suitable base (e.g., pyridine)
- Pentafluorobenzoyl chloride
PFBC: $C_6F_5-CO-Cl$
M 230.52 g/mol, Bp 158–159 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.601$

Anhydrides

★ Key features

- By-products of acylation with anhydrides: corresponding acids excess reagent and the acid formed are to be removed
- Trifluoroacetic acid anhydride TFAA: $CF_3-CO-O-CO-CF_3$
M 210.04 g/mol, Bp 39.5–40.5 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.490$
- Heptafluorobutyric acid anhydride
HFBA: $C_3F_7-CO-O-CO-C_3F_7$
M 410.06 g/mol, Bp 106–107 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.665$

Bisacylamides

★ Key features

- By-products: corresponding neutral acylamides: high volatility
- Easily removed; due to the neutral conditions and their favorable chromatographic characteristics, the removal of surplus bisacylamides and their by-products is often not necessary. Therefore, the sample preparation is much easier.
- *N*-methyl-bis(trifluoroacetamide)
MBTFA: $CF_3-CO-N(CH_3)-CO-CF_3$
M 223.08 g/mol, Kp 123–124 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.55$
- *N*-methyl-bis(heptafluorobutyramide)
MBHFBA: $C_3F_7-CO-N(CH_3)-CO-C_3F_7$
M 423.1 g/mol, Kp 165–166 °C (760 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 1.673$

Methods for acylation

Acylation with fluorinated acid anhydrides (TFAA, HFBA)

- Applicable for alcohols, phenols, carboxylic acids, amines, amino acids and steroids, stable derivatives for FID or ECD detection
- Procedure see page 367 or online at www.mn-net.com/apps
TFAA: MN Appl. Nr. 213041
HFBA: MN Appl. Nr. 213042

Acylation with fluorinated acid amides (MBTFA, MBHFBA)

- Recommended for alcohols, primary and secondary amines as well as for thiols under mild, neutral conditions
- MBTFA also forms very volatile derivatives with carbohydrates [17].
- Procedure see page 367 or online at www.mn-net.com/apps
MBTFA: MN Appl. Nr. 213051
MBHFBA: MN Appl. Nr. 21305

Alkylation / methylation reagents

DMF-DMA *N,N*-dimethylformamide dimethylacetal

- M 119.17 g/mol,
Kp 106–107 °C (760 mm Hg),
Density d₂₀⁴ = 0.897

★ Key features

- Methylation reagents

TMSH (0.2 mol/L in methanol) Trimethylsulfonium hydroxide

- M 94.06 g/mol

★ Key features

- Methylation reagents

Methods for alkylation / methylation

Methylation with TMSH

- Suited for free acids, chlorophenoxy-carboxylic acids, their salts and derivatives as well as for phenols and chlorophenols [18]
- The great advantage is the simplification of the sample preparation. Lipids or triglycerides can be converted to the corresponding fatty acid methyl esters (FAMES) by simple transesterification.
- This reaction is very elegant and convenient, because it is only necessary to add the reagent (0.2 mol/L in methanol) to the sample solution. Removal of surplus reagent is not required, since at 250 °C inside the injector of the gas chromatograph, TMSH will pyrolyze solely to volatile methanol and dimethylsulfide. Due to high reactivity, a complete conversion is usually obtained at ambient temperature. Heating (e.g., 10 min at 100 °C) in a closed sample vial may be necessary, however.
- Procedure see page 367 or online at www.mn-net.com/apps
MN Appl. Nr. 213060

Methylation with DMF-DMA

- Applicable for fatty acids, primary amines and (partially) amino acids, under formation of *N*-dimethyl-aminomethylene amino acid methyl esters [19]
- Since DMF-DMA is a poor solvent, it is essential to use a mixture of DMF-DMA with pyridine, THF, acetone (barbiturates) or another solvent.
- Procedure see page 367 or online at www.mn-net.com/apps
MN Appl. Nr. 213070

Methylation with methanol – TMCS (1 M)

- Suited for the esterification of free carboxylic acids and the transesterification of glycerides. Formation of HCl catalyzes the reaction. TMCS, resp. silyl ethers remove the water and thus drive the reaction to completion. The mixture should be freshly prepared.
- Procedure see page 367 or online at www.mn-net.com/apps
MN Appl. Nr. 213080

For GC separation of FAMES from natural butter fat after derivatization with TMSH see Appl. 201680 at www.mn-net.com/apps

On request for 1 x 10 mL, 1 x 50 mL and 6 x 50 mL also available with screw closure.

Silylation reagents

The most common form of silylation in GC is the replacing of active hydrogen atoms with a trimethylsilyl group (TMS derivative). Less frequently, trialkylsilyl groups or dimethylsilyl groups with longer alkyl chains are also in use. The alkylsilyl group increases volatility and enhances thermal stability of the sample.

Silylation can be catalyzed either acidic by addition of TMCS or basic by addition of pyridine or TSIM (e.g., for sterically hindered functionalities like tert. alcohols).

Reactivity of silylation reagents (acc. to M. Donike): TMS amide (e.g., BSA, MSTFA) > TMS amine = TSIM > Enol-O-TMS ether > S-TMS ether > O-TMS ether > TMS-O-TMS

Stability of the TMS derivatives: O-TMS ether > S-TMS ether > Enol-O-TMS ether > TMS amine > TMS amide

BSA *N,O*-bis-trimethylsilyl-acetamide

• M 203.4 g/mol,
Bp 71–73 °C (35 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 0.832$

★ Key features

- Strong silylation reagent
- Not recommended for use with carbohydrates or very low molecular weight compounds
- Good solvent for polar compounds, but frequently used in combination with a solvent (pyridine, DMF etc.) or with other silylation reagents. Dissolved in DMF, BSA is the prime derivatization reagent for phenols.

☑ Recommended application

- Alcohols, amines, carboxylic acids, phenols, steroids, biogenic amines and alkaloids are derivatized to stable TMS derivatives

BSTFA *N,O*-bis-trimethylsilyl-trifluoroacetamide

• M 257.4 g/mol,
Bp 40 °C (12 mm Hg),
Density $d_{20^{\circ}/4^{\circ}} = 0.961$

★ Key features

- Powerful trimethylsilyl donor with approx. the same donor strength as the nonfluorinated analog BSA
- Advantage of BSTFA over BSA: greater volatility of its reaction products, particularly useful for GC analysis of low boiling TMS amino acids

- BSTFA is nonpolar (less polar than MSTFA) and can be mixed with acetonitrile for improved solubility. For the silylation of fatty acid amides, hindered hydroxyl groups and other difficult to silylate compounds, e.g., secondary alcohols and amines, we recommend BSTFA + 1 % trimethylchlorosilane (TMCS), available under the designation SILYL-991 (see page 366).

Silylation with BSA, BSTFA or SILYL-991 (BSTFA + 1 % TMCS)

MSTFA *N*-methyl-*N*-trimethylsilyl-trifluoroacetamide

• M 199.1 g/mol,
Bp 70 °C (75 mm Hg),
Density d_{20°/4°} = 1.11

★ Key features

- The most volatile trimethylsilyl amide available, very strong TMS donor which does not cause noticeable FID fouling even during long-time measuring series

✔ Recommended application

- Carboxylic acids, hydroxy and ketocarboxylic acids, amino acids, amines, alcohols, polyalcohols, sugars, mercaptans and similar compounds with active hydrogen atoms. Even amine hydrochlorides can be silylated directly.

- The addition of protic solvents in submolar quantities, e.g., TFA for extremely polar compounds (hydrochlorides) or pyridine for carbohydrates, can improve the already good dissolving power of MSTFA.
- Advantages: complete conversion with high reaction rates, even without a catalyst (1–2 % TMCS or TSIM); the by-product of the reaction (*N*-methyltrifluoroacetamide) shows a high volatility and a short retention time

MSHFBA *N*-methyl-*N*-trimethylsilyl-heptafluorobutyramide

• M 299.1 g/mol,
Bp 148 °C (760 mm Hg)

★ Key features

- Similar to MSTFA in reactivity and chromatography
- Either applied alone or in combination with a catalyst (TMCS, TSIM) or another silylation reagent with or without solvent; the by-product *N*-methylheptafluorobutyric amide has a lower retention time than the silylating reagent

✔ Recommended application

- Carboxylic acids, alcohols, phenols, primary and secondary amines and amino acids

- Especially useful for flame ionization detection due to the large ratio of fluorine to silicon of 7:1, since degradation of the surplus MSHFBA does not produce SiO₂ but volatile, non-corrosive silicon compounds

MBDSTFA *N*-methyl-*N*-*tert*-butyldimethylsilyl-trifluoroacetamide

• M 241.3 g/mol,
Bp 170 °C (760 mm Hg),
Density d_{20°/4°} = 1.121

★ Key features

- Silylation reagent that donates a *tert*-butyldimethylsilyl group (TBDMS) for derivatizing active hydrogen atoms in hydroxyl, carboxyl and thiol groups as well as primary and secondary amines
- Fast reactions (typically 5–20 min) with high yields (> 96 %), by-products are neutral volatiles

- TBDMS ethers are 10⁴ times more stable than the corresponding TMS ethers
- Due to the large protecting group, chromatographic retention times are longer. This may have a beneficial impact on some separations. The high concentration of M⁺-57 ions is an interesting topic for GC/MS.

Ultrapure derivatization reagents for acylation, alkylation and silylation.

DMCS Dimethyldichlorosilane

• M 129.06 g/mol,
Bp 70 °C (760 mm Hg),
Density d_{20°/4°} = 1.07

★ Key features

- Used to form dimethylsilyl (DMS) derivatives
- DMS derivatives are much more susceptible to hydrolysis than TMS derivatives, it is therefore vital to have strictly anhydrous conditions during the conversion.

HMDS Hexamethyldisilazane

• M 161.4 g/mol,
Bp 126 °C (760 mm Hg),
Density d_{20°/4°} = 0.7742

★ Key features

- Weak TMS donor; used as a sole reagent, it is slow and not very effective.
- Aprotic solvents like acetonitrile, pyridine, dimethylformamide, carbon disulfide and dimethylacetamide recommend themselves for use with HMDS.
- With catalytic quantities, e.g., 1 % of, or as a mixture with TMCS (2:1, v/v; SILYL-21 and SILYL-2110) it is perfectly suited for a quick and quantitative trimethylsilylation of organic compounds.

TMCS Trimethylchlorosilane

• M 108.7 g/mol,
Bp 57 °C (760 mm Hg),
Density d_{20°/4°} = 0.8580

★ Key features

- Often used as a catalyst with other trimethylsilyl reagents
- As a sole reagent, it can be used to prepare TMS derivatives of organic acids.

TSIM *N*-trimethylsilyl-imidazole

• M 140.3 g/mol,
Bp 94–96 °C (760 mm Hg),
Density d_{20°/4°} = 0.961

★ Key features

- Strongest hydroxyl silylator
- It is remarkable that TSIM reacts quickly and smooth with hydroxyl (even tert. OH) and carboxyl groups, but not with amines. Hence it is especially suited for multiple derivatizations, when compounds with various functional groups are to be derivatized in different ways (e.g., -O-TMS, -*N*-HFB derivatives of catecholamines).

✓ Recommended application

- Alcohols, phenols, organic acids, steroids, hormones, glycols, nucleotides, narcotics
- Reagent of choice for carbohydrates and most steroids (even strongly hindered steroids)

Silylation with TSIM or SILYL-1139 (TSIM – pyridine 11:39)

Reagent mixtures for silylation*

Mixture	Composition	Packing unit				
		20 x 1 mL	1 x 10 mL	5 x 10 mL	1 x 50 mL	1 x 100 mL
SILYL-271	BSA - HMDS - TSIM (2:7:1)	701450.201	701450.110	701450.510		
SILYL-1139	TSIM - Pyridine (11:39)	701460.201				
SILYL-21	HMDS - TMCS (2:1)	701470.201				
SILYL-2110	HMDS - TMCS - Pyridine (2:1:10)	701480.201				
SILYL-991	BSTFA - TMCS (99:1)	701490.201			701490.150	701490.1100

* These products contain harmful substances which must be specially labeled as hazardous. For detailed information please see SDS.

On request for 1 x 10 mL, 1 x 50 mL and 6 x 50 mL also available with screw closure.

Due to their purpose, derivatization reagents are very reactive substances. For this reason, they should be stored cool and protected from moisture. For easy access with a syringe, our derivatization reagents are supplied in vials with crimp caps (exception DMCS and TMCS with screw closure). Vials with pierced sealing disks have limited stability and should be used soon.

Silylation with SILYL-21 or SILYL-2110

- Recommended applications: sugars, glycols, sterically unhindered alcohols, carboxylic acids, acids in urine, hydroxy fatty acids, nucleotides, steroids, vitamin D, xanthone derivatives
- Procedure see page 367 or online at www.mn-net.com/apps

SILYL-21 MN Appl. Nr. 213131
SILYL-2110 MN Appl. Nr. 213132

O-trimethylsilylation with MSTFA followed by N-trifluoroacetylation with MBTF

- Procedure see page 367 or online at www.mn-net.com/apps
- MSTFA/MBTFA MN Appl. Nr. 213140

Acylation

with fluorinated acid anhydrides · TFAA MN Appl. No. 213041 · HFBA MN Appl. No. 213042

Dissolve 0.1 to 1 mg sample in 0.1 mL solvent, add 0.1 mL of the anhydride and heat to 60–70 °C for 1–2 h. If the sample needs not be concentrated prior to the analysis and if there is no danger of catalytically induced side reactions, pyridine is used as solvent. The reaction solution can be injected directly into the gas chromatograph. Otherwise, use a volatile solvent and evaporate solvent, excess reagent and free acid in a stream of nitrogen. Dissolve residue in 50 µL hexane, chloroform etc. and inject aliquot portions.

with fluorinated acid amides · MBTFA MN Appl. No. 213051 · MBHFBA MN Appl. No. 213052

Add 0.5 mL MBTFA or MBHFBA to about 2 mg sample. If there is no reaction at ambient temperature, heat the reaction mixture to 120 °C. Compounds difficult to dissolve, can be trifluoroacetylated in suitable solvent mixtures. It is recommended to use a ratio of solvent to MBTFA or MBHFBA of 4:1. The reaction mixture is chromatographed directly.

Alkylation (Methylation)

with TMSH · MN Appl. No. 213060

Dissolve 100 mg sample (e.g., butter) in 5 mL of a solvent (e.g., *tert.*-butyl methyl ether). Add 50 µL reagent to 100 µL of this solution. The mixture is injected directly. The temperature of the injector must be at least 250 °C.

with DMF-DMA · MN Appl. No. 213070

Add 1 mL of a mixture of DMF-DMA and pyridine (1:1) to 1–50 mg fatty acids. The sample can be injected as soon as a clear solution has formed. It is recommended, however, to heat the solution to 60–100 °C for 10–15 min.

with methanol – TMCS · MN Appl. No. 213080

Add 1 mL methanol – TMCS to about 50 mg carboxylic acid or glyceride and heat. Then evaporate in a stream of nitrogen and dissolve again for injection in, e.g., *n*-heptane.

Silylation

with BSA, BSTFA oder SILYL-991 (BSTFA + 1 % TMCS)

BSA MN Appl. No. 213091 · BSTFA MN Appl. No. 213092 SILYL-991 MN Appl. No. 213093

Add 0.5 mL of the silylation reagent to 1–10 mg sample; if necessary, add some solvent (normally pyridine or DMF [dimethylformamide]). Heat to 60–80 °C for 20 min to increase the reaction rate. 1–2 drops of TMCS (trimethylchlorosilane) or TSIM will also speed up the reaction.

with BSA in combination with other silylation reagents · MN Appl. No. 213100

BSA alone silylates all sterically unhindered hydroxyl groups of the steroid skeleton; addition of TMCS will enable reaction of moderately hindered OH groups (reaction time 3–6 h at 60 °C). After addition of TSIM even strongly hindered hydroxyl groups will react (reaction time 6–24 h at 60 °C).

with MSTFA, MSHFBA or MBDSTFA

MSTFA MN Appl. No. 213111 · MSHFBA MN Appl. No. 213112 · MBDSTFA MN Appl. No. 213113

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 h and can be analyzed directly. If TFA is used as a solvent, proceed as follows [20]: dissolve 1–2 mg sample in 100 µL TFA. Dropwise add 0.9 mL of the silylating reagent. After cooling the sample can be chromatographed directly.

with TSIM or SILYL-1139 (TSIM – pyridine 11:39) · TSIM MN Appl. No. 213121 · SILYL-1139 MN Appl. No. 213122

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 hour and can be analyzed directly. Recommended solvent pyridine. When using SILYL-1139, the presence of water does not interfere.

with SILYL-21 or SILYL-2110 · SILYL-21 MN Appl. No. 213131 · SILYL-2110 MN Appl. No. 213132

Carefully add SILYL-21 or SILYL-2110 to 1–10 mg of the sample. Precipitated ammonium chloride does not interfere. If the sample should not dissolve within 5 min, heat to 75–85 °C. If no mutarotation is to be expected, you may dissolve the sugar in warm pyridine first and then add the silylation reagent. In some cases it may be advantageous to use a different solvent instead of pyridine. For derivatization of 3-ketosteroids we recommend to use DMF (dimethylformamide)

O-trimethylsilylation with MSTFA followed by *N*-trifluoroacetylation with MBTFA · MN Appl. No. 213140

Completely silylate 2 mg of the sample with 0.3 mL MSTFA, e.g., as described on page 363. After addition of 0.3 mL MBTFA the *N*-trimethylsilyl group is replaced by the *N*-trifluoroacetyl group. The mixture can be analyzed directly.

Test mixtures

★ Key features

- Test mixtures for GC capillary columns to control the performance of fused silica capillary columns and the GC system

Ordering information

Test mixtures*

Designation		Pack of	REF
Activity test mixture (FA-TMS test according to Donike) in MSTFA/ <i>n</i> -hexane (1 + 4)	1 mg/mL each of TMS capric acid (C10), TMS myristic acid (C14), TMS stearic acid (C18), TMS behenic acid (C22), hexadecane (C16), eicosane (C20), tetracosane (C24), octacosane (C28)	1 mL	722307
Grob test mixture (modified) in <i>n</i> -hexane	(in mg/mL) <i>n</i> -decane (~ 2.8), <i>n</i> -undecane (~ 2.9), <i>n</i> -octanol (~ 3.6), 2,6-dimethylphenol (~ 3.2), 2,6-dimethylaniline (~ 3.2), methyl decanoate (~ 4.2), dicyclohexylamine (~ 3.1), methyl undecanoate (~ 4.2), methyl dodecanoate (~ 4.1)	1 mL	722310
MN OPTIMA® test mixture in pentane	0.1 % each of undecane, dodecane, octanol, dimethylaniline, decylamine, methyl decanoate, methyl undecanoate, henicane, docosane, tricosane (chromatograms see page 305)	1 mL	722316
MN OPTIMA® amine test mixture in ethanol	0.2 % diisobutylamine, 1 % diethanolamine, 0.2 % 2,6-dimethylaniline, 0.2 % <i>o</i> -propyl-pyridine, 0.2 % dicyclohexylamine, 0.2 % dibenzylamine	1 mL	722317
FAME test mixture in hexane	0.1 % each of FAMEs C4, C6, C8, C10, C12, C14, C16, C18, C18:1 cis, C18:1 trans, C18:2, C18:3, C20, C22, C22:1, C24 (chromatogram see page 334)	1 mL	722320

* These products contain harmful substances which must be specially labeled as hazardous. For detailed information please see SDS.

Grob test mixture (modified) (REF 722310)

MN Appl. No. 211250

Column: OPTIMA® 5, 50 m x 0.25 mm ID, 1.0 µm film
 Injection: 1 µL, split 1:40, 280 °C
 Carrier gas: 1.5 bar H₂
 Temperature: 80 °C → 280 °C (10 min), 8 °C/min
 Detector: FID 280 °C

Peaks:

1. *n*-Decane
2. 1-Octanol
3. *n*-Undecane
4. 2,6-Dimethylphenol
5. 2,6-Dimethylaniline
6. Methyl decanoate
7. Methyl undecanoate
8. Dicyclohexylamine
9. Methyl dodecanoate

Test mixtures for GC capillary columns

Activity test mixture (REF 722307)

MN Appl. No. 211240

Column: OPTIMA® 5, 25 m x 0.32 mm ID, 1.0 µm film
Injection: 1 µL, split 1:40, 300 °C
Carrier gas: 0.6 bar H₂
Temperature: 150 °C → 300 °C (8 min), 10 °C/min
Detector: FID 300 °C

Peaks:

1. TMS capric acid (C₁₀)
2. Hexadecane (C₁₆)
3. TMS myristic acid (C₁₄)
4. Eicosane (C₂₀)
5. TMS stearic acid (C₁₈)
6. Tetracosane (C₂₄)
7. TMS behenic acid (C₂₂)
8. Octacosane (C₂₈)

OPTIMA® Amine test mixture (REF 722317)

MN Appl. No. 250020

Column: OPTIMA® 5 Amine, 30 m x 0.32 mm ID, 1.5 µm film
Injection: 1 µL, split 1:40
Carrier gas: 0.6 bar H₂
Temperature: 100 °C → 280 °C, 10 °C/min
Detector: FID 280 °C

Peaks:

1. Diisobutylamine
2. Diethanolamine
3. 2,6-Dimethylaniline
4. o-Propanol-pyridine
5. Dicyclohexylamine
6. Dibenzylamine

Ferrules for capillary columns

Ferrules

★ Key features

- Graphite ferrules provide the highest temperature stability (up to 450 °C). They are reusable, if handled with care. We also offer 1/16" graphite ferrules specially designed for Carlo Erba / Fisons or for Agilent gas chromatographs.
- Vespel ferrules with 40 % graphite. Temperature-stable up to 400 °C and reusable.

Connectors for capillary GC columns

★ Key features

- Glass connectors for fused silica capillary columns from 0.2 to 0.53 mm ID: manufactured from deactivated glass with slightly tapered inner diameter; used to join two fused silica capillaries of equal or different diameters. Advantages compared to stainless steel fittings are easy connection without tools, optical control during connection, negligible heat capacity and no dead volume.

- Graphseal ferrules for capillary columns: a stainless steel ferrule filled with graphite – the ideal sealing material for capillaries. The capillary is mounted on a 1/16" exit (detector, injector etc.), with the appropriate ferrule, a nut (with slit) and an adapter (see table below).

Tools and general accessories for GC

★ Key features

- Magnifying lens with scale: an essential tool for any laboratory. In capillary GC it is often important to inspect column integrity or check cut ends of capillaries. When closing a column by melting the magnifying lens can be used to check whether the column is really closed or whether an open channel has been formed in the sealed end. Our lens provides 8fold magnification and is supplied with a scale as pictured in the figure below. The space between lines is equivalent to 1/10 mm.
- Diamond file: a useful tool for cutting capillaries and smoothing ends of capillaries. Square capillary ends are especially important for butt connections (e.g., in Valco unions).
- Glass wool, quartz wool and glass fiber wadding are used for, e.g., GC liners, packed GC columns etc.

MACHEREY-NAGEL

OPTIMA[®] 1301 MS

Chromatography

Low bleed GC solution for sophisticated environmental analysis

- Mid-polar columns
Close equivalent to 6 % cyanopropylphenyl – 94 % dimethylpolysiloxane · USP G43
- Low bleed silarylene phase
100 % ion trap and quadrupol MS compatibility
- Excellent deactivation
Reliable quantification even for critical samples at ultra trace levels

MACHEREY-NAGEL

www.mn-net.com

Silarylene synthesis technology - symmetrically substituted siloxanes and integrated phenyl rings

Symmetrically substituted **cyanopropylsilanes**, along with integrated phenyl rings (**silarylene**) resulted in a considerable increase of the chemical and thermal stability of the polysiloxane. This provides significantly extended column life time and less detector contamination due to reduced column bleed.

The OPTIMA® 1301 MS quality outperforms conventional columns with equal phase polarity.

Max. temperature for isothermal operation 300 °C, max. temperature for short isotherms in a temperature program 320 °C

Similar phases

- VF-1301ms, Rxi®-1301Sil MS, TG-1301MS

Columns were tested under equal conditions and not representative of all applications

Chromatography

GC OPTIMA[®] 5 HT

lowest bleeding
optimal deactivation
highest temperature stability

MACHERY-NAGEL

www.mn-net.com

Since 1911

Special features of the new OPTIMA® 5 HT

- ✓ **temperature stability up to 400 °C**
 - the new polyimide cover and thermo-stable OPTIMA® 5 HT-silarylene phase result in a longer lifetime, even at extreme conditions (high isotherm temperatures, steep heating rates > 40 °C/min.)
 - solution for high boiling compounds and simulated distillation
 - at standard conditions: longer life time of the column
 - shorter retention times due to increased heating rates are possible
- ✓ **ultra low bleed silarylene phase with „5-type“ polarity**
 - 100% MS compatible
 - fast method transfer from other 5-type phases possible
- ✓ **excellent deactivation**
 - reliable quantifications even for critical compounds
- ✓ **high temperature stable fused silica**
 - familiar easy handling of the capillary

Stability and long-life features

After 180 h at 380 °C isothermal:

- ✓ the fused silica capillary remains flexible and does not show signs of embrittling
- ✓ separation efficiency and deactivation remain nearly unchanged. The decrease of retention time is less than 4%, this is an indication for the high temperature stability of the cross linked polymer (no bleeding!)

Separation of 10 compounds for 180 h at 380 °C isotherm
Column: OPTIMA® 5-HT, 15 m, 0.25 mm ID, 0.1 µm
(REF 726 102.15)

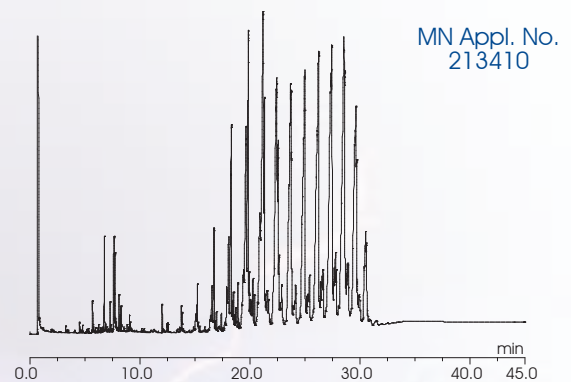

Motor oil/Mineral oil (Type A & B), rapid determination (14 min.) acc. to DIN H-53/ISO DIS 9377 with a steep heating rate (50 °C/min.)

Conditions: OPTIMA® 5-HT, 15 m, 0.32 mm ID, 0.25 µm (REF 726 108.15)
Sample: Mineral oil (type A & B, hydrocarbon-index-kit acc. to DIN EN ISO 9377-2) in hexane
Injection.: 1.0 µl, splitless
Inj. temp.: 300 °C
Gas: Helium, 0.6 bar
Temperature: 40 °C (for 5 min.) -> 390 °C (50 °C/min.)
Detector: FID, 280 °C

Triglycerides in butter

Conditions: OPTIMA® 5-HT, 15 m, 0.25 mm ID, 0.1 µm (REF 726 102.15)
Sample: Butter in CH₂Cl₂, filtered via a CHROMAFIL® Xtra PTFE -20/25 syringe filter
Injection: 2.0 µl, split 1:40
Inj. temp.: 350 °C
Gas: Hydrogen, 0.3 bar
Temperature: 80 °C (for 1 min.) -> 250 °C (20 °C/min.) -> 400 °C (5 °C/min.)
Detector: FID, 380 °C

Diesel sample with calibration, rapid determination (7 min.) via a steep heating rate (50 °C/min.)

Conditions: OPTIMA® 5-HT, 15 m, 0.25 mm ID, 0.1 µm (REF 726 102.15)
Sample: Diesel, 0.5 mg/ml in CH₂Cl₂
Calibration mixture: alkane mix C10-C24
Injection: 1.0 µl, splitless (0 min.), after 0.2 min. split 100 ml/min.
Inj. temp.: 230 °C
Gas: Helium, 0.8 bar
Temperature: 40 °C (1 min.) -> 360 °C (50 °C/min.) (for 20 min.)
Detector: FID, 280 °C

Peaks: 1. Decane (C10), 2. Tetracosane (C24)

Steroides

Peaks: 1. Cholesterol, 2. Campesterol, 3. Stigmasterol, 4. β-Sitosteol

Conditions: OPTIMA® 5-HT, 30 m, 0.32 mm ID, 0.25 µm (REF 726 108.30)
Sample: Steroides in CH₂Cl₂
Injection: 1.0 µl, split 1:10
Inj. temp.: 280 °C
Gas: Helium, 0.8 bar
Temperature: 250 °C -> 360 °C (6 °C/min.)
Detector: FID, 350 °C

ASTM method D 2887, simulated distillation

Conditions: OPTIMA® 5-HT, 15 m, 0.32 mm ID, 0.25 µm
(REF 726 108.15)

Sample: ASTM D 2887 calibration mix in pentane

Injection: 1.0 µl, splitless, cold on column injection

Gas: Helium, 0.6 bar

Temperature: 35 °C -> 360 °C (15 °C/min.) (5 min.)

Detector: FID, 280 °C

Peaks:

1. Hexane, 2. Heptane, 3. Octane, 4. Nonane, 5. Decane,
6. Undecane, 7. Dodecane, 8. Tetradecan, 9. Hexadecane,
10. Octadecane, 11. Eicosane, 12. Tetracosane,
13. Octacosane, 14. Dotriacontane, 15. Hexatriacontane,
16. Tetracontane, 17. Tetratetracontane

MN Appl. No.
213440

Triton test (Methyl- and TMS-ether)

Conditions: OPTIMA® 5-HT, 15 m, 0.25 mm ID, 0.1 µm
(REF 726 102.15)

Sample: Triton-Methyl and -TMS ether
(p-tert-Octylphenol-derivates
with polyethylene glycol-chains)

Injection: 1 µl, split 1:40

Inj. temp.: 350 °C

Gas: Hydrogen, 0,8 bar

Temperature: 200 °C -> 400 °C (6 °C/min.) (20 min.)

Detector: FID, 380 °C

MN Appl. No.
213450

OPTIMA® 5 HT

- max. temperature or isothermal runs: 400 °C
- low bleed column, non polar, ideal for MS detectors, can be rinsed with solvents
- application area: for simulated distillation, hydrocarbon-, fuel-, oil-analysis, high boiling analytes
- chemically bonded, cross-linked silarylene phase, polarity index according to 5% Phenyl / 95% Methyl-Polysiloxane
- similar phases: DB-5HT, VF-5HT, HT-5, XTI-5HT, ZB-5HT
- USP G 27 / G 36

OPTIMA
17 MS

The ultra low bleed version
of a mid polar classic

MACHEREY-NAGEL

www.mn-net.com

Since 1911

Excellent performance and outstanding features due to a new innovative silarylene phase

This unique phase composition provides a lot of advantages:

- ✓ **Mid-polar ultra low bleed silarylene phase (without CN-groups in the polymer)**
 - > 100% Ion-Trap and Quadrupol-MS-compatibility
 - > unlimited use of ECD and NPD-detectors
 - > it is possible to inject aqueous samples, water stable phase
- ✓ **50 % phenyl content in the phase**
 - > easy result transfer from standard "17" phases, i.e. for EPA and ASTM procedures
 - > increased selectivity spectrum and separation efficiency for mid-polar analytes
- ✓ **Temperature stability up to 360°C**
 - > shorter retention times due to higher possible end temperatures
 - > longer column lifetime during "normal" use
- ✓ **Excellent deactivation**
 - > reliable quantification even for critical samples at ultra trace levels

The new OPTIMA® 17 MS is the optimal and modern reference column to a non-polar "1" or "5" type ultra low bleed phase. The 50% phenyl content leads to a significant increase of polarity, compared to these non-polar columns. Thus results in a considerable increase in selectivity and separation efficiency for mid-polar analytes.

Top selectivity for mid-polar analytes

Drugs of abuse

Comparison of a OPTIMA® 5 MS Accent with the new OPTIMA® 17 MS

Conditions: A) OPTIMA® 5 MS Accent
B) OPTIMA® 17 MS
30 m each,
0.25 mm ID,
0.25 µm film

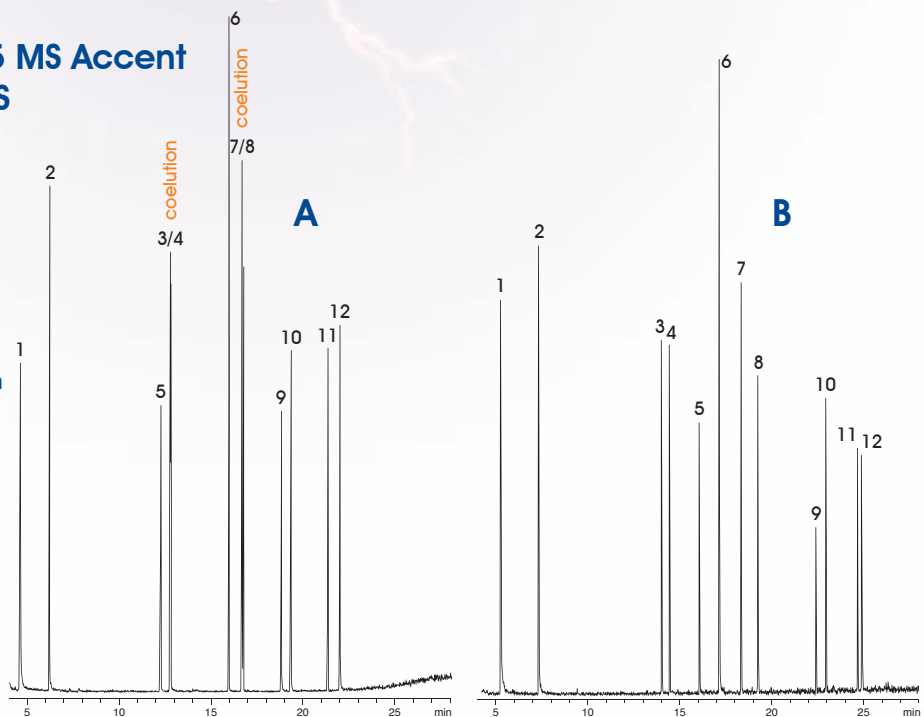

Sample: Drugs of abuse
Carrier gas: Helium
Flow rate: 1 ml/min
Injection: 2 µl, 280 °C,
2 min splitless, 25 ml/min

Temperature: 60°C (2 min)
-> 150°C (25°C/min)
-> 320°C (8°C/min)

Detector: MSD

Peaks:

1. methamphetamine hydrochloride,
2. nicotine, 3. diphenyl hydramine,
4. lidocaine, 5. caffeine, 6. methadone,
7. amitriptyline, 8. cocaine, 9. codeine,
10. diazepam, 11. prazepam,
12. fentanyl

The new
mid-polar
ultra low bleed
GC capillary column
with unique selectivity

MACHERY-NAGEL

www.mn-net.com

Since 1911

Why is the new OPTIMA® 35 MS an interesting phase for you?

Alternative to 17- or 1701 phases in the mid-polar range, often used to back the results obtained on 1- or 5 MS columns.

- ✓ **ultra low bleed silarylene phase with higher polarity**
Your benefit -> Ion-Trap and Quadrupol-MS-compatibility without limitation, increased selectivity spectrum
- ✓ **no CN-groups in the polymer**
Your benefit -> no limits for the use of ECD and NPD-detectors, aqueous stable phase
- ✓ **temperature stability up to 370°C**
Your benefit -> shorter retention times and a longer column lifetime
- ✓ **excellent deactivation**
Your benefit -> reliable quantification even for critical samples at ultra trace levels

Unique selectivity in the mid-polar region

Lowest column bleed -> reduced contamination of the detection system, improved detectability of solutes in trace analysis

In a bleed comparison test between OPTIMA® 35 MS with a conventional 5-, 17- or 1701- phase, the outmatched performance of the silarylene phase can be shown. Measurements up to 360°C result in the lowest bleeding values, even in comparison with competitor 35 MS phases.

The bleeding is a result of the signals at 320°C and 80°C.

Measuring condition: 0.8 bar Helium

Conditions:

Column dimensions 30 m, 0.25 mm, df 0.25 µm
0.5 ml/min He, FID,

Temperature program:

220°C (8°C/min) -> 300°C (20 min), (8°C/min) -> 320°C (20 min), (8°C/min) -> 340°C (20 min), (8°C/min) -> 350°C (20 min), (8°C/min) -> 360°C (20 min)

High temperature stability

-> extended column lifetime, applicable for high boiling compounds

Chromatography

Outstanding features and excellent performance

New silarylene synthesis technology - symmetrically substituted siloxanes and integrated phenyl rings

OPTIMA® 1701

OPTIMA® 1701 MS

The even charge distribution and thereby lower polarizability of the silicon atom in symmetrically substituted **cyanopropylsilanes**, along with integrated phenyl rings (**silarylene**) resulted in a considerable increase of the chemical and thermal stability of the polysiloxane. Substantially reduced column bleed and as a consequence longer column life with less detector contamination qualify the OPTIMA® 1701 MS to outperform conventional columns of equal phase polarity.

14 % cyanopropyl-phenyl – 86 % dimethylpolysiloxane • USP G46

Excellent deactivation

- Reliable quantification even for critical samples at ultra trace levels

Mid-polar low bleed silarylene phase

- 100 % ion trap and quadrupol MS compatibility

Area of application

- Suitable for environmental analysis (e.g., PAH, PCB, pesticides)
- Reference column for structure identification, e.g., in combination with OPTIMA® 5 MS

The new
ultra low bleed
high performance GC columns

MACHEREY-NAGEL

www.mn-net.com

Since 1911

Demands on state-of-the-art fused silica capillary GC columns:

- ✓ lowest column bleed for ultra trace analysis applications
- ✓ excellent signal-to-noise ratio for increased sensitivity
- ✓ suitability for ion-trap- and quadrupol-MS applications
- ✓ high temperature stability
- ✓ perfect inertness for basic compounds
- ✓ short column conditioning times (<2 h → „ready to use“)

MACHEREY-NAGEL is proud to introduce now:

OPTIMA® 1-MS Accent

OPTIMA® 5-MS Accent

OPTIMA® XLB

as three **100% ion-trap compatible ultra low bleed capillary GC columns based on silarylene technology.**

Lowest column bleed ➤ reduced contamination of the detection system
 ➤ improved detectability of solutes in trace analysis

In a bleed comparison test between OPTIMA® 5-MS Accent with a conventional "5"- phase and a column designated explicitly as "5-MS", the outmatched performance of the silarylene phase can be shown.

Injection: 1 µl, split 1:50
 Carrier gas: 80 kPa He, 80 °C → 360 °C at 8 °C/min

The unmatched low background level of the OPTIMA® 5-MS Accent column which is approximately three times lower compared with a "5-MS brand" provides significantly increased sensitivity and allows the use for trace analysis applications particularly of high boiling compounds.

Competitor 5-MS column
 (FID signals in mV)

OPTIMA® 5-MS Accent

High temperature stability ➔ **extended column lifetime**
 ➔ **applicable for high boiling compounds**

	T _{max} (during isothermal operation)	T _{max} (in temperature-programmed GC for short periods of time)
OPTIMA® 1-MS ACCENT	340 °C	360 °C
OPTIMA® 5-MS ACCENT	340 °C	360 °C
OPTIMA® XLB	340 °C	360 °C
Varian VF-5MS	325 °C*	350 °C*
Agilent DB-5MS	325 °C*	350 °C*
Agilent HP-5MS	325 °C*	350 °C*
Restek RTX-5MS	330 °C*	350 °C*

*as indicated from manufacturers in 2005 product catalogs

Optimized tubing surface deactivation ➔ **reduced tailing of polar compounds**

OPTIMA® 5-MS Accent exhibits excellent peak shapes and – asymmetries for i.e. phenol, aniline or dimethylaniline even without previous derivatization.

Short column conditioning times ➔ **time and cost saving during column replacement**

OPTIMA® 5-MS Accent is **ready for use** in low concentration analysis yet after three conditioning runs (80 °C -> 360 °C at 8 °C/min, a total of 1.5 h)!

1. Conditioning run (brand new column after installation)
2. Conditioning run (after 30 min.)
3. Conditioning run (after 1 h)

How to explain the differences between standard OPTIMA® 5, OPTIMA® 5 MS and OPTIMA® 5-MS Accent?

Basically all three stationary phases have identical polarity and from that also similar selectivity features provided that a calculated ratio of 5 % phenyl groups in the polysiloxane layer to all of the above mentioned phases. However on what are the differences based in terms of the column bleed? This can be explained by the different constitution of the phenyl rings in the polysiloxane ring structure.

OPTIMA® XLB \Rightarrow larger ratio of phenyl rings \Rightarrow slightly increased polarity

Improved thermal stability and significantly minimized column bleed has been attained by the insertion of arylene groups in the polymeric siloxane chain!!!

The following application examples exhibit the outstanding performance of the new OPTIMA® Accent columns and Optima® XLB

Organo-phosphor-pesticides

1. nitrobenzene

Sample: 1 µl of 20 ng/µl, PAH Mix
 Injection: splitless (hold 1 min.)
 Inj. temp.: 300 °C
 Carrier gas: hydrogen, 40 cm/sec.
 Temperature: 40 °C (hold 1 min.) -> 200 °C at 20 °C/min. -> 310 °C at 4 °C/min. (hold 5 min.)
 Detection: FID, 310 °C

MN Appl. No. 212800

Rapid separation of PCBs and PAHs

Centre d'Analyses de Recherche, Lab. D'Hydrologie, 67400 Illkirch, France

OPTIMA® XLB, 30 m, 0.25 mm ID, 0.25 µm (Cat. No. 725850.30)

Inj. Vol.: 1 µl, standard 0.005 ng/µl

Inj. Temp.: 250 °C

Inj.: pulsed, splitless

Inj. Pulse: 1.38 bar in 1 min.

Purge flow: 60 ml/min.

Carrier gas: helium

Temperature: 40 °C/(hold 2 min.), -> 30 °C/min. -> 240 °C/(hold 2 min.). -> 10 °C/min. -> 340 °C/(hold 5 min.).

Detection

MS source: 230 °C

Interface: 280 °C

Quadrupol: 150 °C

OPTIMA® 1-MS Accent / OPTIMA® 5-MS Accent / OPTIMA® XLB

- high temperature stability (340 °C for isothermally operated runs / 360 °C for short isothermal runs in temperature programmed GC), columns with film-thicknesses > 0.5 µm have temperature limits of 320 °C / 340 °C
- Very low bleed characteristics, non-polar phases, suitable for ion-trap detection systems
- Application areas: "allround" phases for environmental analysis, trace analysis, EPA methods, pesticides, PCBs, food and drug analysis

OPTIMA® 1-MS Accent

- Chemically bonded, cross-linked phase, polarity index according to 100 % Dimethyl-Polysiloxane
- similar phases: OV-1, DB-1 MS, SE-30, HP-1 MS, Ultra-1, SPB-1, CP-SIL 5 CB MS, Rtx®-1 MS, 007-1, BPX-1, MDN-1, AT™-1 MS, ZB-1, OV-101, VF-1 MS
 - USP G 2

OPTIMA® 5-MS Accent

- Chemically bonded, cross-linked silylarylene phase, polarity index according to 5 % Diphenyl / 95 % Dimethyl-Polysiloxane
- similar phases: SE-54, SE-52, DB-5 MS, HP-5 MS, Ultra-2, Equity™-5, CP-SIL 8 CB low bleed/MS, Rtx®-5 SIL-MS, Rtx®-5 MS, 007-5 MS, BPX-5, MDN-5S, AT™-5 MS, ZB-5, VF-5 MS
 - USP G 27, 36

OPTIMA® XLB

- Chemically bonded, cross-linked silylarylene phase with higher ratio of silylarylene
- similar phases: DB-XLB, Rtx®-XLB, MDN-12, VF-XMS

OPTIMA[®] FFAPplus

New polar Nitroterephthalic acid modified polyethylene glycol column with innovative cross-linking!

- ✓ Improved temperature stability: operating range from 40 °C to 250 °C (isothermal), 260 °C for short periods of time during a temperature program
- ✓ Excellent solvent stability
- ✓ Extended column lifetime
- ✓ Low column bleed, better suited for MS than conventional FFAP columns
- ✓ Allows for injection of aqueous samples
- ✓ Enables the determination of free carboxylic acids without derivatization
- ✓ OPTIMA[®] FFAPplus follows USP G35

Fields of application:

- Alcohols
- Solvents
- Fragrances
- FAMES
- Analysis of foods and natural substances
- BTEX analysis

Solvents

OPTIMA® FFAPplus, 30 m, 0.25 mm, 0.25 µm
 Carrier gas pressure: 1.1 bar He
 Injection volume: 0.1 µL hot needle injection, Split: 1:200
 Injection temperature: 230 °C
 Detector temperature: FID 260 °C
 Oven temperature: 60 °C (8 min), 15 °C/min, 150 °C (10 min)

Peaks:
 1 n-hexane, 2 acetone, 3 ethyl acetate, 4 methyl ethyl ketone (MEK),
 5 dichloromethane, 6 benzene, 7 methyl isobutyl ketone (MIBK),
 8 toluene, 9 n-butyl acetate, 10 undecane, 11 o-xylene

The columns are conditioned at T=260 °C for a longer period of time. At various times, the relative retention of methyl undecanoate is determined with a temperature gradient (80 °C → 240 °C). The relative retention time on the FFAPplus decreases insignificantly, compared with the FFAP.

OPTIMA® FFAPplus, 30 m, 0.25 mm, 0.25 µm
 Carrier gas pressure: 0.8 bar He
 Injection volume: 1 µL, Split 1:50
 Injection temperature: 260 °C
 Detector temperature: FID 260 °C MN Appl. No. 214600

OPTIMA[®] WAXplus

New polar polyethylene glycol (PEG) column with innovative cross-linking and high polarity features!

- ✓ Improved temperature stability compared to conventional PEG columns!
- ✓ Operating range 40 °C – 260 °C (isothermal), for short isotherms in a temperature program up to 270 °C!
- ✓ Chemically bonded and solvent-rinsable!
- ✓ Extended column lifetime!
- ✓ Low column bleed, suited for MSD!
- ✓ Allows for injection of aqueous samples!
- ✓ OPTIMA[®] WAXplus is equivalent to USP phase G16!

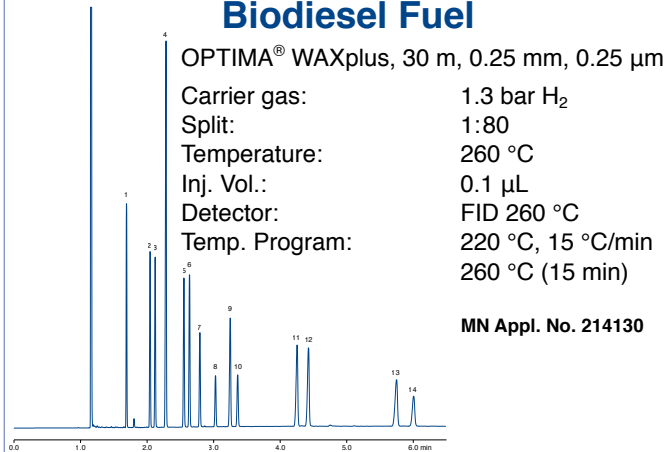

Field of application:

- Alcohols ➤ Solvents ➤ Fragrances ➤ FAMES
- Food analysis ➤ Analysis of biologically active compounds
- BTEX analysis

Fast Separation of FAMES in Biodiesel Fuel

OPTIMA® WAXplus, 30 m, 0.25 mm, 0.25 µm
 Carrier gas: 1.3 bar H₂
 Split: 1:80
 Temperature: 260 °C
 Inj. Vol.: 0.1 µL
 Detector: FID 260 °C
 Temp. Program: 220 °C, 15 °C/min
 260 °C (15 min)

MN Appl. No. 214130

Peaks:

1 Myristic acid, 2 Palmitic acid, 3 Palmitoleic acid,
 4 Methyl heptadecanoate (ISTD), 5 Stearic acid 6 Oleic acid,
 7 Linoleic acid, 8 Linolenic acid, 9 Arachic acid, 10 Gadoleic acid,
 11 Behenic acid, 12 Erucic acid, 13 Lignoceric acid, 14 Nervonic acid

Geranium Oil Ingredients

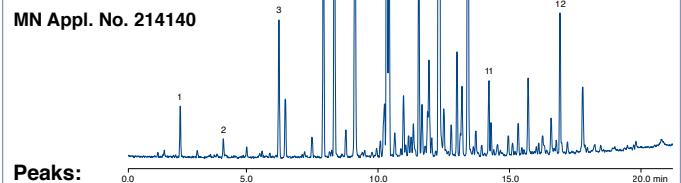

OPTIMA® WAXplus, 30 m, 0.25 mm, 0.25 µm

Split: 1:500
 for 2 min,
 then 1:25

Temp.: 260 °C
 Inj. Vol.: 0.1 µL
 Detector: MSD
 Gas: He,
 40 cm/sec

Temp. Program: 70 °C (2 min)
 8 °C/min
 220 °C (10 min)

MN Appl. No. 214140

Peaks:

1 α-Pinene, 2 Limonene, 3 Rose oxide, 4 Menthone, 5 Isomenthone,
 6 Linalool, 7 Citronellyl formate, 8 Geranyl formate, 9 Geranyl acetate,
 citronellol, 10 Geraniol, 11 Geranyl butyrate, 12 Geranyl tiglate

Scotch Whisky

OPTIMA® WAXplus, 30 m, 0.25 mm, 0.5 µm

Split: 1:30
 Temp.: 260 °C
 Inj. Vol.: 0.1 µL
 Gas: 1.0 bar He
 Detector: FID 260 °C
 Temp. Program: 40 °C (4 min),
 10 °C/min,
 240 °C
 (15 min)

MN Appl. No. 214150

Peaks:

1 Acetaldehyde, 2 Ethyl acetate, 3 Methanol, 4 Ethanol, 5 1-Propanol,
 6 2-Methyl-1-propanol, 7 2-Methyl-1-butanol, 8 Acetic acid
