SGE Capillary Columns

SGE Analytical Science

Few companies can claim to be able to provide a total solution for analytical science; SGE is one of those few. From sample preparation, to injection, the separation and throughout the chromatographic process in either LC or GC there is a SGE product that has been designed to provide you with the results you need time and again.

This brochure highlights some of SGE's capabilities in capillary gas chromatography, specifically in the technically demanding area of capillary columns. SGE columns are engineered for consistent separation performance and can be found in many laboratories being tasked to perform everything from routine analyses to the latest R&D challenges.

forte™ GC Capillary Columns

With over 30 year's experience, GC capillary columns truly are SGE's strength, its forte.

SGE is the only independent manufacturer of GC capillary columns that has the skill and technology to control all critical processes from producing the fused silica capillary tubing, through the phase synthesis, to the validation of the performance of each column.

SGE offers a comprehensive range of **forte™** GC capillary columns for almost any chromatographic application providing the best possible combination of, Performance, Robustness, Reproducibility, Low Bleed and Inertness.

With this brochure we bring to you a small taste of the applications you might consider running on an SGE GC capillary column. If the application is not in this guide, please visit our website www.sge.com.

Guidelines for Choosing Columns

1

Stationary Phase

Effect of Stationary Phase. BTEX analysis on a polar (SolGel-WAX™) column and a 100% dimethyl polysiloxane (SolGel-1ms™), both 30 m x 0.25 mm ID X 0.25 µm film.

- Select the least polar phase that will perform the separation you require
- Non-polar stationary phases separate analytes predominantly by order of boiling point.
- Increase the amount of phenyl and/or cyanopropyl content in the phase, and the separation is then influenced more by differences in dipole moments or charge distributions (BP10 (1701), BPX35, BPX50, BP225 and BPX70)
- To separate compounds that differ more in their hydrogen bonding capacities (for example aldehydes and alcohols), polyethylene glycol type phases are best suited - SolGel-WAX™, BP20 (WAX) and BP21 (FFAP)

Stationary Phase Polarity

2

Internal Diameter

- The smaller the diameter the greater the efficiency, hence better resolution. Fast columns (0.1 mm ID) are used for faster analysis because the same resolution can be achieved in a shorter time.

Effect of Internal Diameter. Polynuclear Aromatic Hydrocarbon (PAH) analysis.

3

Column Length

Effect of Length

- Always try to select the shortest column that will provide the required resolution for the application. If the maximum column length available is being used, and resolution of the sample mixture is still inadequate then try changing the stationary phase or internal diameter.
- Resolution is proportional to the square root of the column efficiency. Therefore, doubling the column length will only increase the resolving power of the column by approximately 40%.

4

Film thickness

Effect of Film Thickness.

- For samples with a variation in solute concentration, a thicker film column is recommended. This will reduce the possibility of broad overloaded peaks co-eluting with other compounds of interest. If the separation of two solutes is sufficient and co-elution is still unlikely, even with large differences in concentration, then a thinner film can be used. The greater the film thickness the greater the retention of solutes, therefore the higher the elution temperature. As a rule, doubling the film thickness results in an increase in elution temperature of approximately 15-20° under isothermal conditions. Using a temperature program, the increase in elution temperature is slightly less.

$$\beta = \frac{id}{4d_f}$$

where
 β = ratio
id = column internal diameter (μm)
 d_f = film thickness (μm)

Formula to calculate Phase Ratio

PHASE RATIO

Film thickness (μm)	Column ID (mm)				
	0.1	0.15	0.22	0.25	0.32
0.10	250	-	550	625	800
0.15	-	250	-	-	-
0.25	-	150	220	250	320
0.50	-	75	110	125	160
1.00	-	-	55	63	80
3.00	-	-	-	-	27
5.00	-	-	-	-	16
					26

Above shows the phase ratio (β) available for the SGE range of capillary columns. Keeping a similar phase ratio when changing column internal diameters will ensure that your chromatographic parameters will not need substantial changes.

- From the phase ratio value β , a column can be categorized for the type of application it would best suit. The smaller the β value, the greater the ratio of phase to the column inner diameter, making it better suited for analyzing volatile compounds. Columns which have thin films are generally better suited for high molecular weight compounds and are characterized by large β values.

Environmental

The widespread use of GC-MS for Environmental analyses requires both low bleed and inertness. The broad range of compounds of interest means that medium polarity phases become more useful. BPX5, BPX35, and BPX50 provide a range of polarities, all with low bleed, high temperature limits, and robustness.

For specialized applications such as PCBs, SGE's HT8 delivers unique separation capabilities.

Applications

• Analysis of PCB'S, PCDT'S, and other complex mixtures using BPX5 and SolGel-1ms

• HT8: The Perfect PCB Column

• Fast Pesticide Screening Using a BPX5 GC Capillary Column

• Analysis of Polychlorinated Dibenzodioxins and Furans on BPX5

• Analysis of Polynuclear Aromatic Hydrocarbons on BPX35

• Analysis of Polynuclear Aromatic Hydrocarbons on BPX5

• Analysis of Volatile Organic Pollutants on BPX-Volatiles

• Applications using BPX90

• Analysis of Volatiles in Drinking Water on 25 m BP624 Column

• Polychlorinated Biphenyls PCB Analysis

Environmental

ANALYSIS OF PCB'S, PCDT'S, AND OTHER COMPLEX MIXTURES USING BPX5 AND SOLGEL-1ms

SIM 7-Group Analysis of 44 mono- to deca-PBDE's via cool-on-column (3- μ L). Deca-PBDE 209 at 310 °C, PBDEs 33/28 and 138/166 partially resolved, PBDE 85 coeluted with 155.

- 44 Mono-Deca-PBDEs
- 6890 GC/Autospec HRMS
- Cool-on-column inlet
- (No liner but 0.53 mm retention gap)
- 12.5 m BPX5 0.15 mm ID 0.1 μ m
- 0.25 m 0.53 mm ID plus
- 2 m 0.25 mm retention gaps
- He programmed 245-415 kPa
- 150 °C-315 °C @ 3 °C/min

SIM 2-Group Analysis for non-o-PCBs. Tetra-PCB's 77 and 81 (A) are resolved from residual o-PCB's (97, 87, 110, and 136). Penta-126 (B), and hexa-169 (C) also detected in eluate 2-basic alumina of DX-3 QC sediment extract (5 of 500 μ L) ion chromatograms (not smoothed). PBDE's are in same eluate (Peterman et al., 2006). Tetra-PBDE 47 from (M-2 Br)+ incidentally detected (B); 0.3 ng/g near lab background.

- Dioxin-like non-ortho PCBs
- HP 5890A GC/VG 70S HRMS
- Heated (275 °C) Direct inlet
- 4 mm Siltek Cyclo-Uniliner
- 30 m SolGel-1ms 0.15 mm ID 0.1 μ m
- 2.5 m x 0.25 mm ID retention gap
- He constant at 415 kPa
- 155 °C (1 min) - 205 °C @ 1.8 °C/min then to 310 °C @ 3.6 °C/min

ACKNOWLEDGEMENT

EXPERT TIP 5

SGE liners undergo a high temperature deactivation process making them ideal for using with active compounds

HT8: THE PERFECT PCB COLUMN

Chromatogram on the left demonstrates clearly the significant difference in selectivity of the HT8 column. By GC/MS, quantitation of CB28 using a standard 5% phenylpolysiloxane column is impossible as coelution with CB31 (with the same number of chlorines) occurs.

HT8 separates the two congeners by a full minute allowing quantitation to be performed with ease.

Food, Flavors and Fragrances

GC analysis in the Food, Flavors and Fragrances area covers a diverse range of compounds that vary in both polarity and boiling point. As a consequence a range of different columns are often required. Chromatograms are often complex, and any single column may not give enough separation of all of the compounds that may be present. Pairs of columns such as BPX5 and SolGel-WAX™ may be used to overcome this problem.

For specific classes of compounds such as fatty acids, specialized columns are often necessary. Short chain fatty acids may be analyzed as free acids on the Nitroterephthalic acid (TPA) modified Polyethylene Glycol BP21 phase. Longer chain fatty acids are usually analyzed as fatty acid methyl esters on wax phases such as BP20 and SolGel-WAX™, or for more demanding applications, BPX70 or BPX90.

Applications

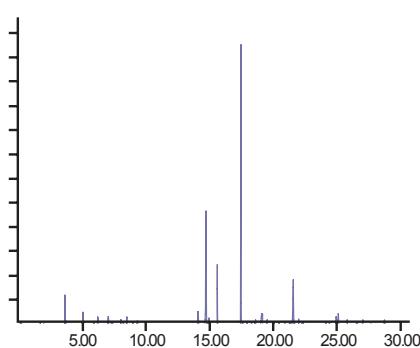

- Comparison of Geranium Oils on SolGel-WAX™
- Analysis of Eucalyptus Oil on SolGel-WAX™
- Analysis of Lavender Oil on Cydex-B
- Analysis of Lavender Oil on BPX-5
- Analysis of Tasmanian Lavender Oil on SolGel-WAX™
- Analysis of Wine on BP20
- Analysis of Scotch Whisky on BP20
- Analysis of Teatree Oil on BPX5
- Analysis of Omega-3 Fatty Acids using BPX70
- BPX90 – a Highly Polar Phase for FAME Analysis
- Analysis of PUFA-1 Marine FAME on BPX70
- Analysis of PUFA-2 Animal FAME on BPX70
- Analysis of PUFA-1 Marine FAME on BPX70

COMPARISON OF GERANIUM OILS ON SOLGEL-WAX™

Comparison of total ion chromatograms (TIC) for Geranium oils from Reunion Island (green trace) and South Africa (red trace).

Subtraction of the two TIC chromatograms shows the difference between the two essential oils.

EXPERIMENTAL CONDITIONS

Column:	SGE forte SolGel-WAX™, 30 m x 0.25 mm x 0.25 µm (SGE P/N 054796)
Temperature Program:	60 °C for 3 min, then 4 °C/min to 220 °C
Carrier Gas:	He
Flow:	0.6 mL/min
Injection Volume	0.3 µL split ratio 30:1
Injection temp:	250 °C
Liner:	SGE P/N 092019 single tapered with quartz wool

ACKNOWLEDGEMENT

We thank M. Bernet and M. Didtsch of the ISIPCA Group, Research and Studies Centre for Fragrance, Cosmetics and Food Flavors, France, for providing these chromatograms. For more information see SGE application note AN-0020-C.

ANALYSIS OF EUCALYPTUS OIL ON SOLGEL-WAX™

Phase:	SolGel-WAX™, 0.25 µm film
Sample:	Neat
Column:	30 m x 0.25 mm ID
Initial Temp:	40 °C, 1 min
Rate 1:	8 °C/min to 220 °C
Final Temp:	220 °C, 5 min
Detector Type:	Mass Spectrometer
Carrier Gas:	He, 25.7 psi
Carrier Gas Flow:	1.8 mL/min
Constant Flow:	On
Average Linear Velocity:	35 cm/sec at 40 °C
Injection Mode:	Split
Split Ratio:	100:1
Injection Volume:	0.2 µL
Injection Temperature:	250 °C
Autosampler:	No
Liner Type:	4 mm ID Single Taper Liner
Liner Part Number:	092017
Column Part Number:	054796
ms-NoVent™ Part Number:	113400
HP5973 restrictor:	113409
Full Scan/SIM:	45-450 m/z

Food, Flavors and Fragrances

ANALYSIS OF WINE ON BP20

Phase:

BP20, 1.0 μ m

Column: 25 m x 0.32 mm ID

Initial Temp: 40 °C, 2 min

Rate 1: 5 °C/min

Temp 2: 50 °C

Rate 2: 15 °C/min

Final Temp: 190 °C

Carrier Gas: H₂, 6psi

Injection Mode: 2 μ L

Column Part Number: 054442

ANALYSIS OF SCOTCH WHISKY ON BP20

EXPERT TIP

For extended life of polar columns, always use an oxygen trap in the carrier gas line.

Phase:

BP20, 1.0 μ m

Column: 12 m x 0.53 mm ID

Initial Temp: 55 °C, 3 min

Rate: 10 °C/min

Final Temp: 120 °C, 0 min

Detector: FID

Sensitivity: 128 x 10⁻¹²AFS

Injection Mode: Split

Column Part Number: 054447

ANALYSIS OF TEATREE OIL ON BPX5

Phase:

BP20, 0.25 μ m film

Column: 30 m x 0.25 mm ID

Initial Temp: 40 °C, 1 min

Rate 1: 5 °C/min to 200 °C

Final Temp: 200 °C

Detector Type: Mass Spectrometer

Carrier Gas: He, 7.0 psi

Constant Flow: 1.0 mL/min.

Average Linear Velocity: 36 cm/sec at 40 °C

Injection Mode: Split

Split Ratio: 200:1

Purge on (Split) Vent Flow: 200 mL/min.

Injection Volume: 0.2 μ L

Injection Temperature: 250 °C

Autosampler: No

Liner Type: 4 mm ID Double Taper Liner

Liner Part Number: 092018

Column Part Number: 054101

Food, Flavors and Fragrances

ANALYSIS OF OMEGA-3 FATTY ACIDS USING A BPX70

Phase: BPX70, 0.25 μ m film
Sample: 10 ppm in methanol
Column: 25 m x 0.32 mm ID
Initial Temp: 80 °C, 2 min
Rate 1: 50 °C/min to 130 °C, 10 min
Rate 2: 2 °C/min to 172°C
Final Temp: 172 °C, 6 min
Detector Type: FID
Detector Temp: 300 °C
Carrier Gas: He, 10 psi
Carrier Gas Flow: 2.2 mL/min.
Constant Flow: On
Average Linear Velocity: 39 cm/sec at 80 °C
Injection Mode: Split
Split Ratio: 58:1
Injection Volume: 1 μ L
Injection Temperature: 250 °C
Autosampler: No
Liner Type: 4 mm ID Focus Liner™
Liner Part Number: 092002
Column Part Number: 054606

ACKNOWLEDGEMENT
SGE would like to thank Masterfoods UK for supplying the sample and chromatographic conditions for this chromatogram. For more information see SGE technical poster TP-0100-C

BPX90 – A HIGHLY POLAR PHASE FOR FAME ANALYSIS

WHAT IS DIFFERENT ?

- BPX90 is a highly polar phase of the poly (biscyanopropylsiloxane) type.
- The phase has excellent thermal stability and a wide operating range (70 - 280 °C).
- The separation mechanisms gives short elution times relative to other polar phases. BPX90 shows low selectivity for non-polar analytes and saturated FAME.
- BPX90 shows enhanced selectivity for polyunsaturated FAME and the selectivity can be tuned with film thickness.
- BPX90 is effective for the separation of cis and trans isomers and positional isomers of FAME analytes.

FAME POLARITY TEST

Supelco 37 FAME test mixture. Columns 15 m x 0.25 mm ID x 0.25 micron film. Temperature programmed 70 °C (hold 1 min) to 150 °C (20 °C/min) to 250 °C (10 °C/min) then hold at 250 °C (5 min). Injector: 240 °C. Detection MS.

C18-C22 FAME test mixture. Columns 30 m x 0.25 mm ID x 0.25 micron film. Isothermal: 180 °C. Injector: 240 °C. Detection FID at 280 °C.

ANALYSIS OF PUFA-1 MARINE FAME ON BPX70

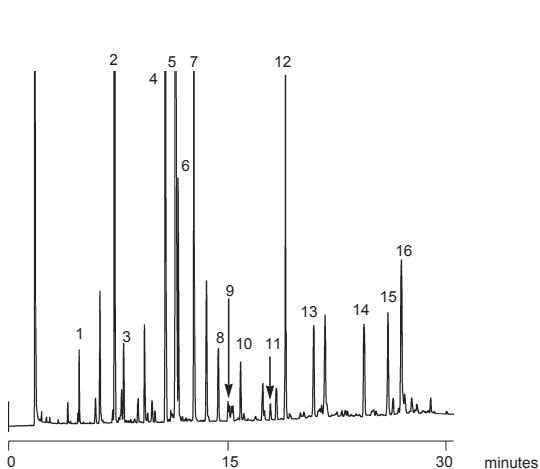

EXPERT TIP

To fully utilize the high thermal stability of BPX70 columns SGE recommend the use of helium when operating above 220/230°C for extended periods.

Phase: BPX70, 0.25 µm film
Column: 25 m x 0.22 mm ID
Initial Temp: 150 °C, 0 min
Program Rate: 2 °C/min
Final Temp: 210 °C, 5 min
Carrier Gas: He, 15 psi
Detector: FID, 280 °C
Sensitivity: 32 x 10⁻¹²AFS
Injection Mode: Split, 50:1
Column Part Number: 054602

ANALYSIS OF PUFA-2 ANIMAL FAME ON BPX70

PUFA-2 ANIMAL FAME

Phase: BPX70, 0.25 µm film
Column: 25 m x 0.22 mm ID
Initial Temp: 150 °C, 0 min
Program Rate: 2 °C/min
Final Temp: 210 °C, 5 min
Carrier Gas: He, 15 psi
Detector: FID, 280 °C
Sensitivity: 32 x 10⁻¹²AFS
Injection Mode: Split, 50:1
Column Part Number: 054602

ANALYSIS OF PUFA-1 MARINE FAME ON BPX70

PUFA-2 ANIMAL FAME

Phase: BPX70, 0.25 µm
Column: 50 m x 0.22 mm ID
Initial Temp: 150 °C, 0 min
Program Rate: 2 °C/min
Final Temp: 210 °C, 5 min
Carrier Gas: He, 15 psi
Detector: FID, 280 °C
Sensitivity: 32 x 10⁻¹²AFS
Injection Mode: Split, 50:1
Column Part Number: 054603

Fuels and Petrochemical

For Fuels and Petrochemical analysis by GC, one of the main considerations is the thermal stability of the column, both physical and chemical. Phases must have high temperature limits to allow the analysis of high boiling point compounds and columns must be able to physically withstand repeated cycling to extreme temperatures. Columns such as SGE's BPX1 and HT5 have been created with these demands in mind.

Where higher polarity is required, such as the separation of aromatic compounds, SolGel-WAX™ and BPX90 provide enhanced selectivity without the unnecessary sacrifice of maximum temperature limits.

Applications

- Total Recoverable Petroleum Hydrocarbons (TRPH) Analysis on Standard and Fast BPX5
- Analysis of Polywax 655 and Refinery Lubrication Oil on HT5
- The Separation of Aromatics from Olefins in Petroleum Samples using BPX90
- Unleaded Gasoline on BPX5
- Fast GC For TPH Analysis
- Simulated Distillation using BPX1-SimD

TOTAL RECOVERABLE PETROLEUM HYDROCARBONS (TRPH) ANALYSIS ON STANDARD AND FAST BPX5

NORMAL

Chromatogram showing separation of Total Recoverable Petroleum Hydrocarbons using a conventional 30 m x 0.25 mm ID BPX5 column with a 0.25 micron film.

Phase: BPX5, 0.25 μm film
TRPH (C8-C40): 5 ng/ μL in dichloromethane
Column: 30 m x 0.25 mm ID
Initial Temp: 40 °C, 2 min
Rate 1: 30 °C/min to 330 °C
Rate 2: NA
Final Temp: 330 °C, 9 min
Detector Type: FID, 350 °C
Carrier Gas: He, 14.4 psi
Carrier Gas Flow : 1.29 mL/min
Constant Flow: On
Average Linear Velocity: 40 cm/sec at 40 °C
Injection Mode: Split, 120:1
Purge On Time: NA
Purge On (Split) Vent Flow: 160 mL/min
Injection Volume: 1 μL
Injection Temperature: 250 °C
Autosampler: Yes
Liner Type : 4 mm ID FocusLiner™ with single taper

Liner Part Number: 092003
Column Part Number: 054101

FAST

Chromatogram showing separation of Total Recoverable Petroleum Hydrocarbon using a FAST BPX5 column.

Phase: BPX5, 0.10 μm film
TRPH (C8-C40) Standard: 5 ng/ μL in dichloromethane
Column: 10 m x 0.10 mm ID
Initial Temp: 40 °C, 1 min
Rate 1: 30 °C/min to 330 °C
Rate 2: NA
Final Temp: 330 °C, 0 min
Detector Type: FID, 350 °C
Carrier Gas: He, 28 psi
Carrier Gas Flow : 0.52 mL/min
Constant Flow: On
Average Linear Velocity: 55 cm/sec at 40 °C
Injection Mode: Split, 120:1
Purge On Time: NA
Purge On (Split) Vent Flow: 62 mL/min
Injection Volume: 1 μL
Injection Temperature: 250 °C
Autosampler: Yes
Liner Type : 2.3 mm ID FocusLiner™

Liner Part Number: 092005
Column Part Number: 054099

ANALYSIS OF POLYWAX 655 AND REFINERY LUBRICATION OIL ON HT5

POLYWAX 655

POLYWAX 655 AND REFINERY LUBRICATION OIL

Phase: HT5, 0.1 μm
Column: 6 m x 0.53 mm ID
Initial Temp: 50 °C
Rate: 10 °C/min
Final Temp: 480 °C, 15 min
Detector: FID
Sensitivity: 40 x 10⁻¹² AFS
Injection Mode: On-Column
Carrier Gas: H₂, 20 mL/min
Solvent: CS₂
Column Part Number: 054661

REFINERY LUBRICATION OIL

Fuels and Petrochemical

THE SEPARATION OF AROMATICS FROM OLEFINS IN PETROLEUM SAMPLES USING BPX90

UNLEADED GASOLINE ON BPX5

Phase: BPX5, 0.25 μm film
Column: 30 m x 0.25 mm ID

Column Part Number: 054101

Components
1. Benzene
2. Toluene
3. Ethylbenzene
4. m,p-Xylene
5. o-Xylene

Sample Introduction:

Injector Temp: 240 °C
Injection Volume: 0.1 μL
Autosampler Syringe: 0.5 μL Removable Needle
Part No. 000410

Septa:

Auto-Sep TT™
Part No. 041882
Split
NA
200 mL/min
149 :1
FocusLiner™
single taper
Part No.092003

Pressure/Flow Values:

Carrier Gas: He
Constant Flow: On
Pressure: 13.6 psi
Column Flow: 1.34 mL/min
Linear Velocity: 30 cm/sec @ 25 °C

Oven Parameters:

Initial Temp: 25 °C
Initial Time: 1 min
Rate 1: 30 °C/min
Final Temp 1: 240 °C
Hold Time: 1 min
Run Time: 9.17 min

Detector Parameters:

Detector Type: FID @ 280 °C

FAST GC FOR TPH ANALYSIS

Phase: BPX5, 0.1 μ m
Column: 5 m x 0.1 mm ID
Initial Temp: 50 °C
Rate 1: 45 °C/min
Final Temp: 300 °C, 0 min
Detector Temp: 270 °C
Detector: FID
Carrier: He, Inlet pressure 40 psi (constant flow mode, linear velocity of 75 cm/sec)

Chromatogram of TPH standards from C8 to C32

Chromatogram showing elution of BTEX in under one minute

SIMULATED DISTILLATION USING BPX1-SIMD

Standard mix for HTSD using BPX1-SimD

Enlarged section of the chromatogram above

Phase: BPX1, 0.1 μ m
Column: 5 m x 0.53 mm ID
Initial Temp: 40 °C
Rate: 15 °C
Final Temp: 420 °C, 5 min
Detector Temp: 440 °C
Carrier Gas: He, 10 mL/min
Instrument: HP 6890
Column Part Number: 054800

Separation Systems Injector
Initial Temp: 40 °C
Rate: 15 °C
Final Temp: 420 °C, 5 min

A portion of the previous chromatogram from C40 to the end of the analysis (expanded vertically) shows excellent resolution and the ability to see beyond C110.

All of the data presented was produced by Dr. Lubkowitz and the staff at Separation Systems Inc. on a system using the Separation System programmed temperature vaporization injector (PTV) and the SIMDIS EXPERT® software

CS2 Blank

Chemical

For general chemical analysis, a good rule of thumb is to use the lowest polarity column that provides sufficient separation. Particular classes of compounds, such as alcohols, amines, or organic acids, may require thicker film phases, or specific phases such as the BPX35 or BP21 to avoid undue peak tailing.

Applications

- Analysis of 18 Alcohols on BP20
- Analysis of Aliphatic Alcohols on BP1
- Analysis of 15 Organic Acids on BP20
- US EPA 625 Phenols Mix on BPX50
- Analysis of Organic Acids in Water on BP21
- Analysis of Amines on BP1
- Analysis of Aromatic Amines on BP5
- Analysis of Aromatic Amines from Diazo Dyes on BPX35
- Analysis of Ketones on Thick Film BPX5
- Analysis of Triethylamine and Triethanolamine on SolGel-1ms™

ANALYSIS OF 18 ALCOHOLS ON BP20

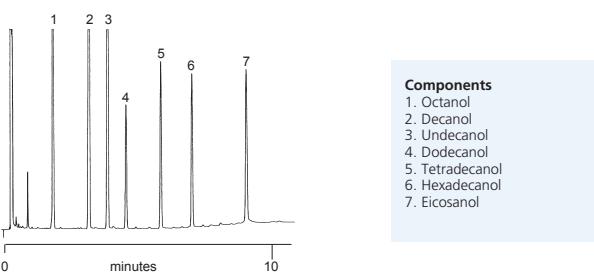

EXPERT TIP

After installing a new column purge with oxygen free carrier gas for at least 30 minutes before heating GC oven.

ALCOHOLS

Phase: BP20, 0.25 µm film
Column: 30 m x 0.25 mm ID
Initial Temp: 45 °C, 2 min
Rate: 3 °C/min
Final Temp: 80 °C, 0 min
Detector: FID
Sensitivity: 128 x 10⁻¹² AFS
Injection Mode: Split
Column Part Number: 054427

ANALYSIS OF ALIPHATIC ALCOHOLS ON BP1

ALCOHOLS

Phase: BP1, 3.0 µm film
Column: 12 m x 0.53 mm ID
Initial Temp: 100 °C
Rate: 10 °C/min
Final Temp: 260 °C
Carrier Gas: N₂
Injection Volume: 0.1 µL
Column Part Number: 054097

ANALYSIS OF 15 ORGANIC ACIDS ON BP20

ORGANIC ACIDS

Phase: BP20, 0.25 µm
Column: 30 m x 0.32 mm ID
Initial Temp: 70 °C
Rate: 10 °C/min
Final Temp: 260 °C, 5 min
Detector: FID
Injection Mode: Split
Carrier Gas: H₂, 6 psi
Column Part Number: 054433

Chemical

US EPA 625 PHENOLS MIX ON BPX50

Components

1. 2-Chlorophenol
2. 2-Nitrophenol
3. 2, 4-Dimethylphenol
4. 2, 4-Dichlorophenol
5. 4-Chloro-3-methylphenol
6. 2, 4, 6-Trichlorophenol
7. 2, 4-Dinitrophenol
8. 4-Nitrophenol
9. 2-Methyl-4, 6-dinitrophenol
10. Pentachlorophenol

US EPA 625 PHENOLS MIX

Phase:

BPX50, 0.25 µm

Column: **30 m x 0.25 mm ID**

Injector Mode: Split, 40:1

50°C, 1 min

Rate 1: 8 °C/min

Final Temp: 300 °C, 10 min

Detector: HP 5973 MSD

Column Part Number: **054751**

ANALYSIS OF ORGANIC ACIDS IN WATER ON BP21

Components

1. Acetic Acid
2. Propanoic Acid
3. iso-Butyric Acid
4. n-Butyric Acid
5. iso-Valeric Acid
6. n-Valeric Acid
7. n-Caprylic Acid
8. n-Heptanoic Acid
9. Lactic Acid

EXPERT TIP

On-column injection and the addition of a 0.03M Oxalic acid (2%) to the injection solution increases the acidity of the column to allow lactic acid to be detected.

ORGANIC ACIDS IN WATER (0.03M OXALIC ACID)

Phase:

BP21, 0.5 µm film

Column: **30 m x 0.53 mm ID**

Initial Temp: 85 °C, 0 min

6 °C/min

Rate: 180 °C, 5 min

Final Temp: FID

Detector: 64 x 10⁻¹² AFS

Sensitivity: On-Column

Column Part Number: **054477**

ANALYSIS OF AMINES ON BP1

Components

1. Aniline
2. Decylamine
3. Dicyclohexylamine
4. Dodecylamine
5. Tetradecylamine

ANALYSIS OF AMINES

Phase:

BP1, 3.0 µm film

Column: **12 m x 0.53 mm ID**

Initial Temp: 70 °C

10 °C/min

Rate: 250 °C

Final Temp: N₂

Carrier Gas: 0.1 µL

Injection Volume: **054097**

ANALYSIS OF AROMATIC AMINES ON BP5

Components

1. Pyridine
2. 2-Methyl Pyridine
3. gamma - BHC
4. Aniline
5. o-Toluidine
6. m-Toluidine
7. 2,6-Dimethylaniline
8. 1,4-Phenyldiamine
9. Nicotine
10. Biphenylamine
11. Bibenzylamine

EXPERT TIP

Using a thicker film helps prevent amines from tailing.

Phase:

Column:

BP5, 1.0 μm film
12 m x 0.53 mm ID
Initial Temp: 60 °C, 0 min
Rate: 10 °C/min
Final Temp: 190 °C, 0 min
Detector: FID
Sensitivity: 128 x 10⁻¹²AFS
Injection Mode: Split
Column Part Number: 054197

ANALYSIS OF AROMATIC AMINES FROM DIAZO DYES ON BPX35

Components

1. Indolin
2. o-Toluidine
3. 2,4-Diaminoanisole
4. p-Chloroaliline
5. p-a residine
6. 2,4,6-Trimethylaniline
7. 4-Chlorotoluidine
8. Unknown
9. 2-Naphthylamine
10. Unknown
11. 4-Aminodiphenyl
12. 4,4'-Oxydianiline
13. 4,4'-Diaminodiphenylmethane
14. Benzidine
15. 3,3'-Dimethyl-4,4'-diaminodiphenylmethane
16. 3,3'-dimethylbenzidine
17. 4,4'-Thiodianiline
18. 3,3'-Dichlorobenzidine
19. 4,4'-Methylenebis(2chloraniline)
20. 3,3'-Dimethoxybenzidine

Phase:

Azo Dyes Standard:

BPX35 0.25 μm film
10 ppm solution in DCM
30 m x 0.25 mm ID
Initial Temp: 50 °C, 2 min
Rate 1: 15 °C/min to 240 °C
Rate 2: 10 °C/min to 280 °C
Final Temp: 280 °C, 25 min
Detector Type: MSD
Carrier Gas: He, 7.1 psi
Carrier Gas Flow : 1.0 mL/min
Constant Flow:
Average Linear Velocity: 36 cm/sec at 50 °C
Injection Mode: Splitless
Purge On Time: 1.0 min
Purge On (Split) Vent Flow: 60 mL/min
Injection Volume: 1 μL
Injection Temperature: 250 °C
Autosampler: No
Liner Type : 4 mm ID Double Taper
Liner Part Number: 092018
Column Part Number: 054701

EXPERT TIP

SilTite™ ferrules eliminate the need for re-tightening following temperature cycling and reduce oxygen levels within the system improving performance

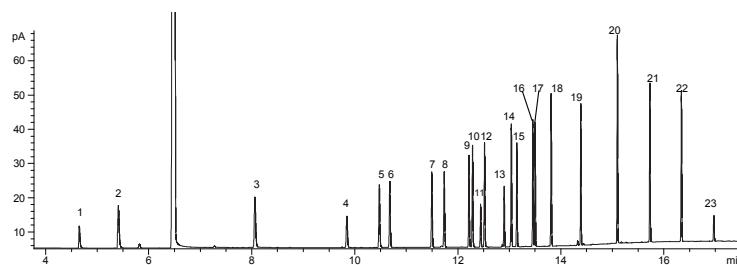

Chemical

ANALYSIS OF KETONES ON THICK FILM BPX5

Components

1. Ethanol
2. Acetone
3. 2-Butanone
4. 3-Methyl-2-butanone
5. 2-Pentanone
6. 3-pentanone
7. 4-Methyl-2-pentanone
8. 3-Methyl-2-pentanone
9. 3-Hexanone
10. 2-Hexanone
11. Mesityl oxide
12. Cyclopentanone
13. 2-Methyl-3-hexanone
14. 4-Methyl-2-hexanone
15. 5-Methyl-2-hexanone
16. 3-Heptanone
17. 2-Heptanone
18. Cyclohexanone
19. 2-Octanone
20. 2-Nonanone
21. 2-Decanone

EXPERT TIP

To prevent decreasing retention times in your chromatography, replace the septum daily.

Pharmaceutical

GC analysis of Pharmaceuticals covers a wide range of compounds that can vary greatly in their molecular weight, reactivity, and pH. From the analysis of low molecular weight residual solvents on a G43 (BPX-Volatiles) to higher molecular weight compounds on a G42 (BPX35), a wide range of GC columns are often specified in the test methods.

Proper deactivation of GC consumables such as liners and columns becomes increasingly important where system inertness has to be demonstrated. SGE's unique, high temperature gas phase deactivation ensures maximum inertness and minimal activity from our columns and consumables.

Applications

- USP Methods
- Analysis of Tricyclic Antidepressants on BPX35
- Analysis of Dioxane Impurities on BP20
- Analysis of a Common Solvent Mixture on a Thick Film BPX5
- Analysis of a Common Pharmaceutical Solvent on BPX-Volatiles
- Analysis of a Common Pharmaceutical Solvent on BPX-Volatiles
- Analysis of Class I Solvents on BPX-Volatiles
- Analysis of the Separation of the Class III Solvents on BPX-Volatiles

USP Methods

Method	Phase Composition	SGE Phase Recommendation
G1	Dimethylpolysiloxane oil	BP1, SOLGEL-1ms™
G2	Dimethylpolysiloxane gum	BP1, SOLGEL-1ms
G3	50% Phenyl - 50% Methylpolysiloxane	BPX50
G5	3-Cyanopropylpolysiloxane	BPX70
G7	50% 3-Cyanopropyl - 50% Phenylmethylsilicone	BP225
G14	Polyethylene glycol (average molecular weight of 950-1,050)	BP20(WAX), SOLGEL-WAX™
G15	Polyethylene glycol (average molecular weight of 3,000-3,700)	BP20(WAX), SOLGEL-WAX
G16	Polyethylene glycol (average molecular weight of 15,000)	BP20(WAX), SOLGEL-WAX
G17	75% Phenyl - 25% Methylpolysiloxane	BPX50
G19	25% Phenyl - 25% Cyanopropylmethylsilicone	BP225
G20	Polyethylene glycol (average molecular weight of 380-420)	BP20(WAX), SOLGEL-WAX
G25	Polyethylene glycol TPA (Carbowax 20M terephthalic acid)	BP21(FFAP)
G27	5% Phenyl - 95% Methylpolysiloxane BP5,	BPX5
G28	25% Phenyl - 75% Methylpolysiloxane	BPX35
G32	20% Phenylmethyl - 80% Dimethylpolysiloxane	BPX35
G35	Polyethylene glycol & diepoxyde esterified with nitrotetraphthalic acid	BP21(FFAP)
G36	1% Vinyl - 5% Phenylmethylpolysiloxane	BP5, BPX5
G38	Phase G1 plus a tailing inhibitor	BP1, SOLGEL-1ms
G39	Polyethylene glycol (average molecular weight of 1,500)	BP20(WAX), SOLGEL-WAX
G41	Phenylmethyldimethylsilicone (10% phenyl substituted)	BP5, BPX5
G42	35% Phenyl - 65% Dimethylvinylsiloxane	BPX35
G43	6% Cyanopropylphenyl - 94% Dimethylpolysiloxane	BP624
G46	14% Cyanopropylphenyl - 86% methylpolysiloxane	BP10 (1701)

Fused Silica Tubing

- Quality guaranteed
- Chemically inert and thermally stable
- Suitable for organic and aqueous solvents
- Ideal for biotechnology applications
- Custom-made tubing available upon request
- Available deactivated for guard column material
- Tubing protected with a high temperature Polyimide resin (+400 °C)

ETP multiplier

- Air stable
- 2 year shelf life guarantee
- Discrete dynode design results in extend operating life
- Total compatibility with all major quadrupole, magnetic sector and TOF instruments

ANALYSIS OF TRICYCLIC ANTIDEPRESSANTS ON BPX35

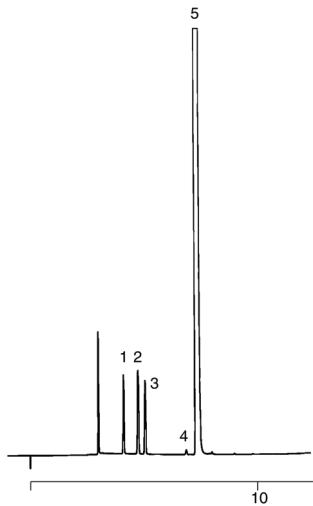

Components
1. Amitriptyline
2. Trimipramine
3. Nortriptyline
4. Doxepin
5. Desipramine

TRICYCLIC ANTIDEPRESSANTS

Phase: BPX35, 0.25 μ m
Column: 25 m x 0.22 mm ID
 Initial Temp: 210 °C, 1 min
 Rate: 5 °C/min
 Final Temp: 280 °C
 Carrier Gas: Helium, 150 kpa
 Injection Mode: Split (20:1)
 Detector: FID, 380 °C
Column Part Number: 054711

ANALYSIS OF DIOXANE IMPURITIES ON BP20

Components
1. Methanol
2. Dichloromethane
3. Ethanol
4. Dioxane impurity
5. Dioxane

Phase: BP20, 1.0 μ m
Column: 25m x 0.53 mm ID
 Initial Temp.: 40°C, 2 min
 Rate: 10 °C/min
 Final Temp.: 120 °C
 Detector: FID, 280 °C
 Injector Mode: Split, 30:1,
 Carrier Gas: Hydrogen, 2 psi
 Injection Volume: 0.2 μ L
Column Part Number: 054448

ANALYSIS OF A COMMON SOLVENT MIXTURE ON A THICK FILM BPX5

Components
1. Methanol
2. Ethanol
3. Acetone
4. Isopropyl alcohol
5. Acetonitrile
6. Dichloromethane
7. 2-Butanone
8. Ethyl acetate
9. Benzene

Phase: BPX5, 1.0 μ m film
Sample: neat
Column: 60m x 0.25 mm ID
 Initial Temp: 32 °C, 5 min.
 Rate 1: 20 °C/min to 190 °C,
 Final Temp: 190°C, 2 min.
 Detector Type: FID
 Detector Temp.: 360 °C
 Carrier Gas: He, 26.9 psi
 Carrier Gas Flow: 1.9 mL/min.
 Constant Flow: On
 Average Linear Velocity: 35 cm/sec at 40 °C
 Injection Mode: Split
 Split Ratio: 100:1
 Injection Volume: 0.3 μ L
 Injection Temperature: 250 °C
 Autosampler: No
 Liner Type: 4 mm ID Single Taper Liner
Liner Part Number: 092017
Column Part Number: 054123

Pharmaceutical

ANALYSIS OF COMMON PHARMACEUTICAL SOLVENT ON BPX-VOLATILES

Components	
1. Methanol	12. Ethyl acetate
2. Ethanol	13. 2-Butanol
3. Ethyl ether	14. Tetrahydrofuran
4. Acetone	15. Chloroform
5. iso-propyl alcohol	16. Cyclohexane
6. Acetonitrile	17. Benzene
7. Methylene chloride	18. n-Heptane
8. t-Butanol	19. n-Butanol
9. Hexane	20. 1,4-Dioxane
10. Propanol	21. Pyridine
11. 2-Butanone	22. Toluene
	23. Dimethylformamide

Phase: BPX-Volatiles, 1.4 μ m film
Sample: 200 ppm in methanol
Column: 30 m x 0.25 mm ID
Initial Temp: 35 °C, 15 min
Rate 1: 5 °C/min to 100 °C
Final Temp: 100 °C, 2 min
Detector Type: Mass Spectrometer
Carrier Gas: He, 25.7 psi
Carrier Gas Flow: 1.8 mL/min
Constant Flow: On
Average Linear Velocity: 35 cm/sec at 35 °C
Injection Mode: Split
Split Ratio: 100:1
Injection Volume: 0.5 μ L
Injection Temp: 250 °C
Autosampler: No

ANALYSIS OF COMMON PHARMACEUTICAL SOLVENT ON BPX-VOLATILES

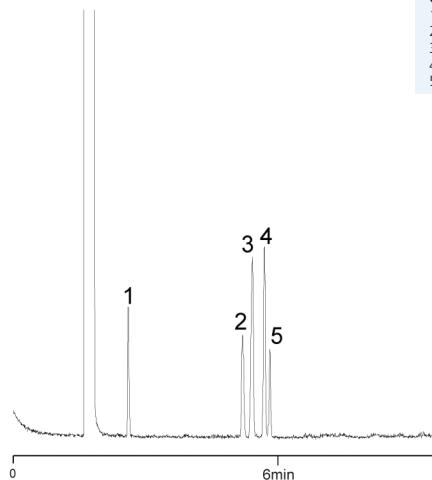

Components	
1. Dichlorodifluoromethane	32. Chlorobenzene
2. Chlormethane	33. Ethylbenzene
3. Vinyl chloride	34.
4. Bromomethane	1,1,2-Tetrachloroethane
5. Chloroethane	35. m-Xylene
6. Trichlorofluoromethane	36. p-Xylene
7. 1,1-Dichloroethene	37. o-Xylene
8. Dichloromethane	38. Styrene
9. trans-1,2-Dichloroethene	39. Bromoform
10. 1,1-Dichloroethane	40. Isopropylbenzene
11. 2,2-Dichloropropane	41. Bromobenzene
12. cis-1,2-Dichloroethene	42.
13. Bromochloromethane	1,1,2,2-Tetrachloroethane
14. Chloroform	43. 1,2,3-Trichloropropane
15. 1,1,1-Trichloroethane	44. n-Propyl benzene
16. 1,1-Dichloropropene	45. 2-Chlorotoluene
17. Carbon tetrachloride	46. 1,3,5-Trimethylbenzene
18. Benzene	47. 4-Chlorotoluene
19. 1,2-Dichloroethane	48. tert-Butylbenzene
20. Trichloroethene	49. 1,2,4-Trimethylbenzene
21. 1,2-Dichloropropane	50. sec-Butylbenzene
22. Dibromomethane	51. 1,3-Dichlorobenzene
23. Bromodichloromethane	52. p-Isopropyltoluene
24. cis-1,3-Dichloropropene	53. 1,2-Dichlorobenzene
25. Toluene	54. n-Butylbenzene
26. trans-1,3-Dichloropropene	55. 1,4-Dichlorobenzene
27. 1,1,2-Trichloroethane	56. 1,2-Dibromo-3-chloropropane
28. Tetrachloroethene	57. 1,2,4-Trichlorobenzene
29. 1,3-Dichloropropane	58. Hexachlorobutadiene
30. Dibromochloromethane	59. Naphthalene
31. 1,2-Dibromoethane	60. 1,2,3-Trichlorobenzene

Phase: BPX-Volatiles 1.4 μ m film
USEPA 502.2 mix: 200 ppm in Methanol
Column: 30 m x 0.25 mm ID
Initial Temp: 40 °C, 0 min
Rate 1: 6 °C to 210 °C
Rate 2: 15 °C to 240 °C
Final Temp: 240 °C, 5 min
Detector Type: Mass Spectrometer
Carrier Gas: He, 22.8
Carrier Gas Flow: 1.3 mL/min
Constant Flow: On
Average Linear Velocity: 35 cm/sec at 40 °C
Injection Mode: Split
Split Ratio: 50:1
Injection Volume: 1 mL

ANALYSIS OF THE SEPARATION OF THE CLASS III SOLVENTS ON BPX-VOLATILES

Components

1. Pentene
2. Ethanol
3. Ethyl ether
4. Acetone
5. iso-Propyl alcohol
6. Ethyl formate
7. Methyl acetate
8. Dichloromethane
9. Methylt-butyl ether
10. n-Propanol
11. Ethyl acetate
- 12.2-Butanone (MEK)
13. Tetrahydrofuran
14. iso-Butanol
15. sec-Butanol
16. iso-Propyl acetate
17. Heptane
18. Acetic acid
19. n-Butanol
20. Propyl acetate
21. 4-Methyl-2-pentanone
22. Iso-Amyl alcohol
23. Iso-Butyl acetate
24. n-Amyl alcohol
25. Butyl acetate
26. Dimethyl sulfoxide

Phase: BPX-Volatiles 1.4 μ m film
Sample: 200 ppm in methanol
Column: 30 m x 0.25 mm ID
Initial Temp: 50 °C, 5 min
Rate 1: 10 °C/min to 85 °C, 1 min
Rate 2: 15 °C/min to 170 °C,
Final Temp: 170 °C
Detector Type: Mass Spectrometer
Carrier Gas: He, 6.7 psi
Carrier Gas Flow: 0.9 mL/min
Constant Flow: On
Average Linear Velocity: 35 cm/sec at 50 °C
Injection Mode: Split
Split Ratio: 100:1
Injection Volume: 0.4 μ L
Injection Temp: 250 °C
Autosampler: No
Liner Type: 4 mm ID Single Taper Liner
Liner Part Number: 092017
Column Part No: 054980

Forensic

Forensic and Toxicology analyses face similar challenges as those found in pharmaceutical assays. These methods are often very challenging due to the analysis of very active compounds as well as coming from samples that are detrimental to GC systems. These compounds are generally basic in nature that makes inertness of the system components critical to successful determinations.

The robustness is another critical aspect of clinical analyses. The natures of sample compounds and matrices are extremely arduous on the analytical system. SGE's columns are designed to withstand these ordeals and provide excellent lifetimes in difficult analyses.

Applications

- Analysis of Acid/Neutral Drugs on BPX35
- Analysis of Basic Drugs on BPX35
- Analysis of Underivatized Barbiturates on BP5
- Analysis of Various Drugs on BPX50
- Analysis of a Variety of Antidepressant and Anticonvulsant Drugs on BPX50

ANALYSIS OF ACID/NEUTRAL DRUGS ON BPX35

Components

1. Ethosuximide
2. Barbital
3. Aprobarbital
4. Butabarbital
5. Amobarbital
6. Pentobarbital
7. Secobarbital
8. Meprobamate
9. Carisoprodal
10. Glutethimide
11. Phenobarbital
12. Methaqualone
13. Primidone

ACID/NEUTRAL DRUGS

Phase:**BPX35, 0.25 µm****Column:****25 m x 0.22 mm ID**

Initial Temp:

Full Scan / SIM: Full scan 45-450

ANALYSIS OF A VARIETY OF ANTIDEPRESSANT AND ANTICONVULSANT DRUGS ON BPX50

**FocusLiner™ improves reproducibility by:**

Promoting uniform sample vaporization

Maximizing sample vaporization on an inert surface

Acting as a particulate filter for dirty samples

Improving injection reproducibility 10-fold

Wiping needle tip during injection through fixed quartz wool

Liner deactivated at high temperatures with wool in situ using SGE's high quality deactivation processes

GC Column Replacement Guide

Column to Replace	Description	SGE Phase
DB-1, HP-1, Ultra-1, SPB-1, CP-Sil 5CB, RSL-150, RSL-160, Rtx®-1, ZB-1, CB-1, OV®-1, PE-1, 007-1(MS), SP-2100, SE-30, RH-1, CC-1, CP-Sil 5CB MS, VF-1ms, Petrocol DH	100% Dimethyl Polysiloxane	BP1
Unique highly inert phase	SolGel + 100% Dimethyl Polysiloxane	SolGel-1ms™
DB-HT Sim Dis, DB-2887, Rtx-2887, HP-1, Petrocol 2887, Petrocol EX2887	100% Dimethyl Polysiloxane	BPX1
Petrocol DH, DB-Petro	100% Dimethyl Polysiloxane	BP1-PONA
DB-5, DB-5.625, Rtx-5, HP-5, Ultra-2, PTE-5, PB-5, MDN-5, CP-Sil 8CB, VB-5 & ZB-5	5% Phenyl Polysiloxane	BP5
DB-5, DB-5ms, HP-5, Ultra-2, Rtx®-5, Rtx-5sil MS, Rtx 5MS, AT-5, AT-5MS, 007-5MS, SPB-5,CP-Sil 8CB, VF-5ms, RSL-200, CB-5, OV®-5, PE-5, 007-2(MPS-5), SE-52, SE-54, XTI-5, PTE-5, CC-5, RH-5ms, ZB-5	5% Phenyl Polysilphenylene-siloxane	BPX5
MXT-1 SimDist, HT-SimDist, DistCB, MXT-500	5% Phenyl Polycarborene-siloxane	HT5
No equivalent, unique high temperature column with special selectivity	8% Phenyl Polycarborene-siloxane	HT8
DB-35, DB-35ms, Rtx-35, HP-35, HP-35MS, SPB-35, MDN-35, VB-50, ZB-35	35% Phenyl Polysilphenylene-siloxane	BPX35
DB-608, Rtx-35, SPB-608	35% Phenyl Polysilphenylene-siloxane	BPX608
OV-17, SP-2250, DB-17ms, DB-17ht, Rtx-50, SPB-50, HP-50+, HP-17, VB-50/608, ZB-50	50% Phenyl Polysilphenylene-siloxane	BPX50
DB-23, CP-Sil 88, VF-23ms, SP-2330, SP-2380, Rtx®-2330, 007-23, AT-Silar, PE-23	70% Cyanopropyl Polysilphenylene-siloxane	BPX70
Unique highly inert phase	SolGel + Polyethylene Glycol	SolGel-WAX™
DB-Wax, Rtx-Wax, Stabilwax, HP20M, HP-Wax, HP-INNOWax, Supelcowax-10, AT-Wax, Nukol, CP Wax 2CB, VB-WAX, ZB-WAX	Polyethylene Glycol	BP20 (Wax)
DB-FFAP, HP-FFAP, Stabilwax-DA, CP Wax 58CB, VB-FFAP, ZB-FFAP	Polyethylene Glycol (TPA treated)	BP21 (FFAP)
DB-1701, Rtx-1701, HP-1701, SPB-7, CP-Sil 19CB, VB-1701, ZB-1701	14% Cyanopropylphenyl Polysiloxane	BP10 (1701)
HP-225, DB-225, Rtx-225	50% Cyanopropylphenyl Polysiloxane	BP225
DB-624, HP-VOC, Rtx Volatiles, VOCOL, VB-624, ZB-624	Cyanopropylphenyl Polysiloxane	BP624, BPX-Volatiles
Cyclodex-B, Rt-BDEXm	Permethylated Beta Cyclodextrin	CYDEX-B
Unique highly polar phase	90% Cynopropyl Polysilphenylene-siloxane	BPX90

GC Troubleshooting and Maintenance

Symptom	Possible cause	Solution
High baseline level	Septum bleed and/or contaminated liner	Replace septa and insert a new inlet liner.
	Poor carrier gas quality causing phase decomposition	Ensure gas traps are installed correctly to remove moisture, organics and oxygen. Ensure high purity carrier gas is used.
	Maximum temperature of the phase has been exceeded	Lower maximum program temperature.
	Highly acid or alkaline samples	Neutralize sample before injecting
	Dirty samples	Filter sample. Use a FocusLiner™.
Split peaks	Contaminated solvent	Dilute sample. Use a high purity solvent.
	Poor manual injection technique	Increase the plunger depression speed.
	Mixed solvent	Change to a single solvent
	Compound degradation	Can happen with some pesticides. Lower injector temperature. Recondition capillary column and re-inject sample.
Fronting peaks	Column inserted too far into injector	Reposition column according to manufacturer's instructions.
	Too much sample injected on to column	Dilute sample. Use a thicker film. Increase the split ratio.
Tailing peaks	Column contamination	Cut 50cm off the front of the column and re-install in the injector. Recondition column.
	Sample not suitable for phase polarity	Choose a more polar column.
	Poorly deactivated inlet liner	Replace with a new fully deactivated inlet liner.
	Graphite ferrule contamination in the start of the column	Cut 5cm off the front of the column and re-install in the injector
Broad peaks	Make-up gas flow rate for atmospheric detectors is low	Increase make up gas flow according to manufacturer's instructions.
	Carrier gas flow is low	Check carrier gas flow.
	Split gas flow is too low	Increase split flow or use the 'solvent effect' to focus peaks.
	Column contamination	Cut 50cm off the front of the column and re-install in the injector.
	Co-elution of peaks	Change column polarity or lower temp. program ramp rate to separate peaks.
	Change in sample concentration	Check injector conditions are reproducible e.g. temperature and split ratio.
Shifting retention times	Mass spectrometer sampling rate is too low causing triangular-looking peaks	Increase sampling rate or reduce number of ions detected in SIM mode.
	Leaking septum	Tighten septum cap or replace with new septum.
	Carrier gas velocity has changed	Verify carrier gas flow rate. Check inlet pressure on GC. Ensure pressure in gas line and gas cylinder is OK
	Method temperature has changed	Re-check temperature method conditions
	Column dimensions and film thickness have changed after installing a new column	Re-check dimensions on column tag against column description.
	Sample concentration has changed – more has been injected on column	Dilute sample or increase split ratio.
	Dirty column. Extra non-volatile material deposited on the column has caused a change in column polarity	Cut 50cm off the front of the column and re-install in the injector Recondition column.
Loss of peak resolution	Aging column has resulted in a substantial loss of phase causing a loss in column resolving power	Replace column.
	Method temperature has changed	Re-check temperature method conditions
	Carrier gas velocity has changed	Re-check carrier gas velocity and optimize to Van Deemter optima.
	Dirty column. Extra non-volatile material deposited on the column has caused a change in column polarity	Cut 50cm off the front of the column and re-install in the injector.
	Manual injection technique or operator has changed	Ensure technique is consistent.
No peaks	GC incorrectly wired	Check all connections from GC to computer / integrator.
	Wrong detector is being monitored	Check injector number is consistent with detector number being monitored.
	FID flame is out	If using water, reduce injection volume. Water can extinguish the flame. Check flame gas pressures
	Syringe is blocked or leaking around plunger	Use a known good syringe to confirm this is the problem.
	Massive leak in system	Check all column and injector connections.
	Column is blocked	Check column for breakage. This can sometimes be difficult to locate as the fused silica can break leaving the polyimide outer coating intact. Cut 5cm off the front and back ends of the column and re-install.
	Concentration of sample has changed	Re-confirm with a known standard concentration injection.
Loss of sensitivity	Flame gas flow rates and/or make-up gas flow have changed	Check flame gas pressures
	System has become active	Replace inlet liner with a new deactivated liner. Cut 50cm off the front of the column, re-install in the injector and re-condition the column
	Splitless conditions have changed	Re-check solvent and method temperatures.
	Syringe has become contaminated from previous sample	Ensure syringe has been thoroughly washed with solvent between injections. Sometimes this can involve 20 solvent rinses.
Ghost peaks	New standards have impurities	Confirm by using a different source of primary standards.
	Impurities in solvent	Use a different type of solvent or confirm by using a different source of the same solvent.
	Septum bleed	Can appear as discrete peaks in temperature program runs. Will disappear with isothermal analysis. Replace septum. Could also be from sample vial septa
	Peaks are still eluting from previous run	Peaks will appear broader for that part of the chromatogram. Confirm by extending run time and ensuring all peaks have eluted from sample.
	Flashback has happened	Inject twice the amount of pure solvent (this may need to be repeated). Carrier gas lines may also need to be cleaned
